Subject: Long Term Electricity Network Scenarios

Colin

Some very high (superficial?) thoughts on additional potential scenario drivers for your 'long term networks' project:

Economic factors, such as pricing / incentives - I could see how these might be outputs from the modelling, but there's at least a feedback loop and probably a direct influence on how the network could be configured

Policy factors - different policy directions and their link to economics/ legislation could drive very different outcomes and its not obvious how these 'shocks' naturally fall out of modelling

International connectivity - Could interconnector infrastructure and flows have a bigger influence in the time period you're looking at?

If you felt it would be interesting to have an end user perspective I'd be happy to come along on the 18th if there was space.

Best wishes for what sounds like a fascinating project
