Project code:	SPD2004	Question Number	SPD016
Question date	30/08/2012	Answer date	03/09/2012
Submission section question relates to	6		
Topic	Project Readiness		
Question	Several sub-tasks of work packages rely on techniques or technologies that have been researched and trialled in other projects. How will SPD ensure that they obtain sufficient information / handover to implement these? And how will they be assured that these will work?		
Notes on question			
Answer	<p>We have already engaged with SSE on this subject and agreed to hold a joint workshop to share the practical elements of deploying technology within their LCNF projects. This has been acknowledged through a letter of support which is included in the document appendices. We also believe that it is within the spirit of LCNF that all DNOs share information and learning from their respective projects such that other DNOs can build on this learning.</p> <p>To ensure that we get this learning consistently and that an ongoing analysis of other project learning is maintained, a dedicated work package (6.1) has been proposed. This will focus on engaging with other DNOs to capture such learning and ensure the project benefits from this.</p> <p>The unique elements of this project, in particular the management of the exporting distribution network, community level connections and active management of generation around complex constraints all feature new challenges which have not been addressed in other LCNF projects and are designed to create new learning.</p>
