

GD1 Price Control Financial Handbook

Publication date: 1 April 2013

Contact: Ofgem Regulatory Finance Team

Tel: 020 7901 7000

Email: regulatoryfinance@ofgem.gov.uk

Overview:

This is the GD1 Price Control Financial Handbook which forms part of Special Condition 2A (Governance of GD1 Price Control Financial Instruments) of the Gas Transporter Licence held by gas distribution network operators.

This document consists of:

- a) a description of the GD1 Price Control Financial Model ('PCFM') and the Annual Iteration Process for it, used to update the licensee's base revenue allowances during the course of the RIIO-GD1 price control period;
- b) an overview of the GD1 Price Control Financial Methodologies under which revisions to the variable values in the PCFM are determined for the Annual Iteration Process, in accordance with the special conditions of the Licence; and
- c) a series of chapters containing the detailed methodologies relating to PCFM Variable Values.

The procedures relating to modification of this Handbook and the PCFM are contained in Special Condition 2A.

An up to date version of this handbook and the PCFM (in Microsoft Excel® format) can be accessed on the Ofgem website.

Context

The RIIO-GD1 price control arrangements are the first to apply Ofgem's RIIO framework (Revenue = Incentives + Innovation + Outputs). The RIIO approach places more emphasis on incentivising network owners and managers to achieve the outputs needed to deliver sustainable energy networks at value for money for existing and future consumers.

The RIIO-GD1 price control is longer than the previous gas distribution price controls (known as GDPCR), running for eight years instead of five. This provides for a longer period of settled price control arrangements and should facilitate improved strategic planning and a long term approach to gas distribution infrastructure management.

However, the RIIO price control mechanisms are also more dynamic. Under the GDPCR price controls, base revenue allowances typically representing over 80 per cent of network operation revenues, were set up-front for the whole of the price control period, changing only with RPI indexation. A number of significant adjustments to reflect activity levels and varying financial conditions were necessarily left in abeyance until the subsequent five-yearly review. Under RIIO-GD1, comprehensive adjustments to base revenue will be made each year in respect of the licensee's network business.

This more sophisticated approach involves an annual iteration of the PCFM using updated variable values. This gives rise to a requirement for licence conditions and methodologies to govern the determination of revised PCFM Variable Values and the Annual Iteration Process.

This Handbook (which forms part of Special Condition 2A) sets out the required processes and methodologies. To promote transparency, up to date copies of both the handbook and the PCFM will be maintained on the Ofgem website.

Introduction

The GD1 Price Control Financial Handbook (this handbook) is one of the Price Control Financial Instruments referred to in Special Condition 2A (Governance of Price Control Financial Instruments) of the Gas Transporter Licence held by gas distribution network operators. It describes the PCFM and the Annual Iteration Process for it, by which annual adjustments to the licensee's base revenues will be calculated. It also contains the Price Control Financial Methodologies ('the methodologies'), specified in relevant special conditions, which will be used to determine appropriate revisions to the variable values contained in the PCFM to facilitate calculations under the Annual Iteration Process. The methodologies also describe the intent and effects of revising the various PCFM Variable Values.

This handbook, the constituent methodologies and the PCFM (together the Price Control Financial Instruments) form part of Special Condition 2A. The Financial Instruments are subject to a formal change control process set out in that condition.

The PCFM Annual Iteration Process approach has been adopted because:

- it is consistent with the aims of the RIIO price control, embodying more 'real time' adjustments to financial allowances;
- it handles complex computational interactions between financial adjustments without the need for unwieldy algebra on the face of special conditions;
- it provides for consistent treatment of the Totex¹ aspects of the price control;
- it maintains transparency on adjustments to base revenues, since the licence, methodologies, PCFM and variable values will be published; and
- it allows stakeholders to keep abreast of allowed revenue levels and to carry out business sensitivity analysis.

In any case of conflict of meaning, the following order of precedence applies:

- (i) the main text of the relevant licence condition(s),
- (ii) the handbook and constituent methodologies, and
- (iii) the PCFM.

¹ Total Expenditure – see Glossary

Terms used in this handbook

References to the Authority and Ofgem

The Gas and Electricity Markets Authority ("the Authority") is established by section 1 and Schedule 1 to the Utilities Act 2000. The Office of the Gas and Electricity Markets Authority ("Ofgem") is the office that supports the Authority.

In this handbook the text refers to the Authority and Ofgem interchangeably.

Throughout this handbook:

- (a) 'licence' means a Gas Transporter Licence issued under s7 of the Gas Act 1986 that includes "Standard Special Conditions applicable to all DN Licensees: Part D";
- (b) 'licensee' means every holder of a licence as defined at a) above, save that in the case of National Grid Gas plc, (and in accordance with the definition of Distribution Network at Special Condition E1 of its licence) any reference to the 'licensee' shall be a reference to each of the four individual Distribution Networks owned and operated by National Grid Gas plc (ie the East of England, London, North West and West Midlands Distribution Networks) together with the administrative and management resources deployed by National Grid Gas plc in operating each of those Distribution Networks, as though each of those Distribution Networks and the associated administrative and management resources were themselves the holder of a licence as defined at (a) above;
- (c) 'this handbook' means the GD1 Price Control Financial Handbook;
- (d) 'Special Condition' means any one of the "Special Conditions contained in Special Conditions Applicable to the Licensee (DN): Part E – RDN" of the licensee's licence;
- (e) 'Price Control Period' means the RIIO-GD1 price control period which runs from 1 April 2013 to 31 March 2021.

Where the meaning of other terms used in this handbook is not clear from the context, they will either be defined/explained in the chapter concerned or in the appended Glossary.

1. The PCFM and the Annual Iteration Process

Overview

1.1. The special conditions specify the opening base revenue² levels for the licensee for each Formula Year of the price control period, reflecting the Authority's final proposals for the RIIO-GD1 price control settlement.

1.2. The PCFM has been designed to calculate incremental changes to the licensee's opening base revenues for each Formula Year so that the updated base revenue allowances reflect the adjustment schemes specified in the licence and detailed in the methodologies in this handbook. The adjustments fall into three broad categories:

- legacy price control adjustments – the close out of schemes and mechanisms from preceding price control periods;
- financial adjustments covering tax, pension and cost of debt issues; and
- adjustments relating to actual and allowed total expenditure (Totex³) and the Totex incentive mechanism.

1.3. The calculations take place under the Annual Iteration Process for the PCFM described below and are manifested as a PCFM output value for the term 'MOD' which is then applied as shown in the simplified formula below:

Base Revenue for year t = opening base revenue for year t + MOD for year t.

Price base

1.4. The PCFM works predominantly in a constant 2009-10 price base. This is consistent with the opening base revenue values set down in the licence. The value of the term MOD is calculated in 2009-10 prices. Indexation is provided for in the base revenue formula set out in the special conditions.

1.5. Some tax calculations internal to the PCFM use nominal prices, based on embedded RPI forecast data. Interest cost and tax allowance calculations relate to the licensee's accounting profit and loss position. For regulatory purposes, this is considered in nominal prices, so the use of nominal prices in the PCFM tax calculations ensures that revenue allowance calculations more accurately reflect the profile of tax expenses of the licensee.

² Base revenue is the largest component of the licensee's overall allowed revenue

³ See Chapter 6 paragraphs 18 to 19

1.6. Where a methodology in this handbook calls for values to be deflated from a nominal price base, used in price control review information reporting, to the 2009-10 price base used in the PCFM, the following formula will be used:

$$\text{value}_{2009-10} = \text{value}_{\text{nominal price year}} \times \frac{\text{RPI}_{2009-10}}{\text{RPI}_{\text{nominal price year}}}$$

Where:

| | |
|--|--|
| $\text{value}_{2009-10}$ | means the deflated value in the 2009-10 price base; |
| $\text{value}_{\text{nominal price year}}$ | means the value in nominal prices, used in price control review information reporting; |
| $\text{RPI}_{2009-10}$ | means the arithmetic average of the Retail Prices Index (all items) figures published by the Office for National Statistics for each calendar month in Formula Year 2009-10 rounded to three decimal places; and |
| $\text{RPI}_{\text{nominal price year}}$ | means the arithmetic average of the Retail Prices Index (all items) figures published by the Office for National Statistics for each calendar month in the Formula Year referred to in the price control review information in question rounded to three decimal places. |

Temporal convention

1.7. As indicated above, the MOD term is used to adjust the opening base revenue figure for each Formula Year t during the price control period⁴. References in this handbook to Formula Years are made relative to that usage. For example, in a context where MOD_t applied in the formula for base revenue in 2015-16, a reference in the same context to Formula Year $t-1$ would mean 2014-15 and so on.

The PCFM and the Annual Iteration Process

1.8. The PCFM exists as a constituent part of Special Condition 2A (Governance of GD1 Price Control Financial Instruments). It has an input area for each licensee containing both fixed values and a PCFM Variable Values table. The base revenue figure for each licensee for each Formula Year of the price control period is calculated using the fixed values, the PCFM Variable Values, and the formulae and functions embedded in the PCFM.

1.9. At the outset of the price control period, the base revenue figures calculated by the PCFM, using the variable values subsisting at that time, constitute the opening base revenue values for the licensee. Before the calculation of opening base

⁴ In 2013-14, the first year of the price control period, the licence specifies that the value of MOD is zero.

revenues are performed, Ofgem will commission an external audit of the functionality of the PCFM.

1.10. Subject to paragraph 1.11, by 30 November in each Formula Year t-1, or as soon as is reasonably practicable thereafter, Ofgem will determine whether any PCFM variable values for the licensee should be revised in accordance with the special conditions and methodologies referred to in chapters 3 to 10 of this handbook.

1.11. The last Formula Year in which there will be an Annual Iteration Process for the PCFM is Formula Year 2019-20 for the purpose of determining the value of the term MOD for Formula Year 2020-21.

1.12. In order to facilitate the determination of revised PCFM Variable Values by 30 November, Ofgem will normally expect to apply the following annual cut-off dates:

- (a) 30 September in respect of functional changes to the PCFM; and
- (b) 31 October in respect of information submitted by the licensee and used under the Price Control Financial Methodologies.

1.13. In applying the cut-off referred to in paragraph 1.12(b), Ofgem will, through business correspondence, apprise the licensee of any provisionality it has attached to information submissions, which might entail a restatement of the information by the licensee for the purpose of making a further revision to the PCFM Variable Value(s) concerned for use in a subsequent Annual Iteration Process.

1.14. The Authority will give the licensee at least 14 days notice of any revised PCFM Variable Values in accordance with requirements in the licence to allow for any representations. The Authority will then (by 30 November in Formula Year t-1, or as soon as is reasonably practicable thereafter) specify any PCFM Variable Value revisions in a formal direction to the licensee. The direction will also include a screenshot of the PCFM Variable Values table for the licensee, showing the state of all variable values after the directed revisions, with revised values emboldened.

1.15. Having directed revisions to PCFM Variable Values for the licensee, Ofgem will carry out the Annual Iteration Process:

- revised PCFM Variable Values will be inputted in the appropriate Formula Year column of the PCFM Variable Values Table for the licensee;
- the PCFM calculation functions will be re-run;
- all calculated values within the PCFM will be updated, including:
 - the base revenue figure for the licensee for each Formula Year of the price control period, and
 - the modelled RAV balance for the licensee;
- the PCFM will output the value of MOD for Formula Year t for the licensee.

1.16. The output value of MOD_t for the licensee will reflect the difference between the most recently calculated base revenue figures for the licensee held in the PCFM before the Annual Iteration Process and the most recent base revenue figures for the licensee held in the PCFM after the Annual Iteration Process recalculations. The PCFM calculations will apply appropriate time value of money⁵ adjustments to the calculation of MOD_t , so that the licensee will be in the same position as if adjustments to base revenue for years prior to Formula Year t had been notified to it in the Formula Year concerned.

1.17. Changes to base revenue figures calculated under the Annual Iteration Process may be upwards or downwards and, accordingly, the value of MOD_t may be positive or negative. A key point to note is that once the value of MOD has been directed for a particular Formula Year, it is not retrospectively changed as a result of a subsequent Annual Iteration Process – the value becomes a matter of record alongside the opening base revenue value for the same year.

1.18. The steps of the Annual Iteration Process are specified in Special Condition 2B (Annual Iteration Process for the PCFM).

1.19. The Authority will issue a direction to the licensee giving the value of MOD_t by 30 November in each Formula Year $t-1$ ⁶ or as soon as reasonably practicable thereafter. In practice, it is expected that the value of MOD_t will be included in the direction of revised PCFM Variable Values referred to in paragraph 1.14. The value of MOD_t in the direction will be stated in £m to one decimal place.

1.20. The deadline of 30 November in Formula Year $t-1$ for the direction of PCFM Variable Value revisions and for the value of MOD_t reflects:

- the deadline of 31 July in Formula Year $t-1$ by which the licensee must submit its price control information returns (covering activity in Formula Year $t-2$) to Ofgem; and
- the need for the licensee to have confirmation of its allowed base revenue in time to calculate and issue its indicative use of system charges by 31 December in Formula Year $t-1$.

1.21. In the unlikely event that the Authority does not direct a value for MOD_t by 30 November in Formula Year $t-1$, paragraphs 11 to 13 of Special Condition 2B specify that:

- the Annual Iteration Process will stand uncompleted;
- the Authority must complete the Annual Iteration Process as soon as reasonably practicable by directing a value for MOD_t ; and

⁵ See Glossary

⁶ The first such direction will be given by 30 November 2013.

- in the intervening period, the value of MOD_t shall be held to be equal to the value ascertained by:
 - taking a copy of the PCFM in its state following the last completed Annual Iteration Process (excluding the effect of any functional modifications under Special Condition 2A made after the completion of that Annual Iteration Process);
 - using the selection facilities on the user interface sheet contained in that copy to select:
 - the name of the licensee; and
 - the Formula Year equating to Formula Year t ; and
 - recording the value of the term MOD_t for the Licensee that is shown as an output value.

1.22. Table 1.1 below summarises the timings for the Annual Iteration Process during the price control period.

Table 1.1 Summary of timings for the Annual Iteration Process

| Annual Iteration Process | | | | | |
|--------------------------|--------------------------------|--|--|------------------------------------|--|
| AIP month | PCFM Functional change cut-off | Regulatory reporting information cut-off | Proposed PCFM Variable Value revisions | AIP completed and MOD_t directed | Relevant Year t in which MOD_t applies |
| Nov-13 | 30 Sep 13 | 31 Oct 13 | 15 Nov 13 | 30 Nov 13 | 2014-15 |
| Nov-14 | 30 Sep 14 | 31 Oct 14 | 15 Nov 14 | 30 Nov 14 | 2015-16 |
| Nov-15 | 30 Sep 15 | 31 Oct 15 | 15 Nov 15 | 30 Nov 15 | 2016-17 |
| Nov-16 | 30 Sep 16 | 31 Oct 16 | 15 Nov 16 | 30 Nov 16 | 2017-18 |
| Nov-17 | 30 Sep 17 | 31 Oct 17 | 15 Nov 17 | 30 Nov 17 | 2018-19 |
| Nov-18 | 30 Sep 18 | 31 Oct 18 | 15 Nov 18 | 30 Nov 18 | 2019-20 |
| Nov-19 | 30 Sep 19 | 31 Oct 19 | 15 Nov 19 | 30 Nov 19 | 2020-21 |

State of the PCFM

1.23. As mentioned in paragraph 1.8, the PCFM exists as a constituent part of Special Condition 2A and will be maintained by Ofgem in its official records. The state of the PCFM remains constant unless and until changed by either:

- (a) an Annual Iteration Process - which will change PCFM Variable Values and recalculated values which are directly or indirectly dependent upon them; or
- (b) a modification of the PCFM under the procedures set out in Special Condition 2A (Governance of GD1 Price Control Financial Instruments).

1.24. Ofgem will keep a log of modifications to the PCFM.

1.25. A copy of the PCFM in its latest state will be maintained on the Ofgem website. This will allow the licensee and other stakeholders to make copies of the PCFM so that they can:

- use their own forecasts of PCFM Variable Value revisions to forecast base revenue positions and to conduct sensitivity analysis; and
- reproduce the calculation of MOD_t by 30 November in each Formula Year $t-1$.

The model is designed to be as 'user friendly' as possible for this purpose.

1.26. An updated copy of the PCFM will be uploaded to the website by 30 November each year (after each Annual Iteration Process) and the file will be named "GD1 Price Control Financial Model 20XX-XX" (where 20XX-XX represents Formula Year $t-1$).

Error of functionality in the PCFM

1.27. In the unlikely event that an error of functionality is discovered in the PCFM, the following procedure would be followed:

- the issue would be considered at the earliest opportunity by the PCFM Working Group (see next section) and a corrective modification determined by Ofgem;
- if the functional error had distorted the calculation of a previously directed value of the term MOD, the determined modification would include any adjustments necessary to correct for that distortion on an NPV neutral basis in the next calculation of the term MOD_t ;
- the procedure in Special Condition 2A for modifications to the PCFM would be followed.

The PCFM Working Group

1.28. Ofgem will facilitate an industry expert working group to review issues arising with respect to the form or usage of the PCFM. The terms of reference for The PCFM Working Group ('the working group') are set out below.

1.29. In accordance with the provisions of Part A of Special Condition 2A (Governance of GD1 Price Control Financial Instruments), the Authority will have regard to any views expressed by the working group when assessing whether any proposed modification of the PCFM would be likely to have a significant impact on the licensee or other stakeholders.

Terms of reference

Purposes of the working group

1.30. The purposes of the working group are:

- (i) to review the ongoing effectiveness of the PCFM in producing a value for the term MOD for each Formula Year, that appropriately adjusts the licensee's opening base revenue so that its allowed expenditures and performance under incentive schemes are properly reflected;
- (ii) to provide, when requested by the Authority, its views to the Authority on the impact of any proposed modifications to the PCFM in accordance with Part A of Special Condition 2A; and
- (iii) to provide such views or recommendations to the Authority with regard to the PCFM as it sees fit.

Composition

1.31. The composition of the group will be:

- Ofgem (chair);
- Ofgem (secretary);
- one representative per licensee;
- Energy Networks Association representative (optional).

Timing and duration of the group's work

1.32. The working group's incumbency will run from 1 April 2013 to 31 March 2021.

1.33. The group will meet at least once between 1 January and 31 July during each calendar year, but may meet more frequently if required, in particular in relation to the provision of views on the impact of proposed PCFM modifications (see paragraph 1.30(ii)).

1.34. Representatives may attend meetings in person, or at the discretion of the chair, through video or telephone conferencing facilities.

1.35. A meeting of the working group will be quorate, for the purpose of expressing a view or recommendation in respect of the PCFM, if at least one representative from Ofgem, and at least two licensee representatives (each from a different licensee) are present.

Resources

1.36. Meeting facilities will be provided or coordinated by Ofgem. Ofgem will keep notes of key points of discussion and views expressed at meetings, and of any recommendations made by the working group with respect to the PCFM.

2. The GD1 Price Control Financial Methodologies

2.1. The GD1 Price Control Financial Methodologies set out in this handbook describe the basis for a range of annual adjustments to the licensee's opening base revenue allowances for the purposes of the RII0-GD1 price control arrangements.

2.2. The main purpose of each methodology is to set out the way in which one or more PCFM Variable Values are to be revised for the purposes of the Annual Iteration Process for the PCFM under which values of the term MOD_t are calculated (see chapter 1). Any revised PCFM Variable Values determined under the methodologies will replace (over-write) the existing values contained in the PCFM Variable Values Table for the licensee in the PCFM as part of the Annual Iteration Process.

2.3. The methodologies are presented in chapters 3 to 10 of this handbook, and are referenced in the associated special conditions of the licence. As constituent parts of this handbook, the methodologies are part of Special Condition 2A (Governance of GD1 Price Control Financial Instruments) and are subject to the modification provisions set out in that condition.

2.4. The methodologies are subordinate to the special conditions of the licence. If there is any inconsistency between a licence condition and a methodology, then the licence condition takes precedence.

Methodologies in this handbook

2.5. The PCFM Variable Values to be determined under the methodologies in this handbook are listed in Table 2.1 below.

Table 2.1

| No | PCFM Variable Value | Special Condition | Description | Type of variable value |
|--|---------------------|-------------------|--|------------------------|
| <u>Specified financial adjustments</u> | | | | |
| 1 | EDE | 3C | Pension Scheme Established Deficit | revenue allowance |
| 2 | APFE | 3C | Pension Scheme Administration and PPF levy | revenue allowance |
| 3 | TTE | 3C | Tax liability – tax trigger events | revenue allowance |
| 4 | TGIE | 3C | Tax liability – gearing/interest costs | revenue allowance |

| No | PCFM Variable Value | Special Condition | Description | Type of variable value |
|--|---------------------|-------------------|--|------------------------|
| 5 | CDE | 3C | Allowed percentage cost of debt | Percentage |
| <u>Totex incentive mechanism</u> | | | | |
| 6 | ALC | 3B | Actual load related capex expenditure | actual expenditure |
| 7 | AOC | 3B | Actual other capex expenditure | actual expenditure |
| 8 | ACO | 3B | Actual controllable opex | actual expenditure |
| 9 | ARE | 3B | Actual replacement expenditure | actual expenditure |
| <u>Allowed Totex expenditure adjustments</u> | | | | |
| 10 | IAEEPS | 3F | Uncertain costs – enhanced physical site security | actual expenditure |
| 11 | IAESW | 3F | Uncertain costs – specified street works | actual expenditure |
| 12 | IAECCB | 3F | Uncertain costs – connection charging boundary changes | actual expenditure |
| 13 | IAESM | 3F | Uncertain costs – smart metering roll out | actual expenditure |
| 14 | IAELLC | 3F | Uncertain costs – large load connections | actual expenditure |
| 15 | IAEFP | 3F | Uncertain costs – fuel poor network extensions | actual expenditure |
| 16 | IAECA | 3F | Uncertain costs – Central Agent | actual expenditure |
| 17 | RE | 3E | Mains and services replacement expenditure | allowed expenditure |
| 18 | IRM | 3D | Innovation roll out mechanism | allowed expenditure |
| <u>Legacy price control adjustments</u> | | | | |

| 20 | LRAV | 3A | adjustments to allowed revenue Legacy price control adjustments to RAV | allowance true-up RAV additions |

2.6. Specified financial adjustments (numbers 1 to 5 in Table 2.1) relate to the adjustment mechanisms set out in the 'Finance Supporting Document' in the RIIO-GD1 Final Proposals. Overviews of the adjustments and the methodologies for determining revisions to the associated PCFM Variable Values are contained in chapters 3 to 5 of this handbook.

2.7. The Totex incentive mechanism (numbers 6 to 9 in Table 2.1) applies to any overspend or underspend by the licensee against its RIIO-GD1 Totex expenditure allowances. An overview of the mechanism and the methodology for determining revisions to the associated PCFM Variable Values is contained in chapter 6 of this handbook.

2.8. Allowed Totex expenditure adjustments (numbers 10 to 18 in Table 2.1) cover a range of Totex adjustment schemes under which allowed expenditure can be adjusted under a specified formula or through an application and assessment process. The methodologies for determining revisions to the associated PCFM Variable Values are contained in chapters 7 to 9 of this handbook.

2.9. Legacy price control adjustments (numbers 19 and 20 in table 2.1) relate to activities which took place in the price control period prior to RIIO-GD1 but in respect of which a financial adjustment is required because:

- the outturn data for Formula Year 2012-13 was not available when opening base revenue for the RIIO-GD1 price control;
- cost totals for items subject to true-up or logging-up were not available when opening base revenues for the price control period were set; or
- it is possible for pre-RIIO-GD1 expenditure allowances to be adjusted under the terms of a RIIO-GD1 special condition.

Processing of different types of PCFM Variable Value under the Annual Iteration Process

2.10. In general terms, the different types of variable value specified in column 5 of Table 2.1 are processed under the Annual Iteration Process for the PCFM in the following ways:

Allowed expenditure

These amounts are modelled, subject to the Totex Capitalisation Rate, as:

- fast money – flowing directly to the base revenue figure for the Formula Year to which the allowed expenditure relates; and
- additions to the licensee's RAV in the Formula Year to which the allowed expenditure relates, generating a slow money adjustment to allowed revenues through the cost of capital return, depreciation and Totex incentive mechanism.

Revenue allowance

These amounts flow directly to the base revenue figure for the Formula Year to which the adjustment circumstance relates (although there will also be ancillary financial effects under the modelling treatment).

Percentage

This type of variable value applies to the cost of corporate debt only and revised values for Formula Year t will flow into calculations of the return on RAV component of slow money.

Actual expenditure

This type of variable value applies to the Totex incentive mechanism only and revised values affect fast and slow money calculations for the Formula Years concerned. These values will be obtained from the licensee Regulatory Reporting Pack relating to Formula Year t-2. Since the RRP contains values in nominal prices, these will be deflated to a 2009-10 price base using published RPI data so that they are consistent with the 2009-10 price base used in the PCFM.

True-up revenue allowance

These amounts will usually flow directly to the base revenue figure for Formula Year 2013-14, because they relate to activity levels or outturn values for the price control period prior to RIIO-GD1.

True-up RAV additions

These additions to the licensee's RAV generate a slow money adjustment to allowed revenues through the cost of capital return, depreciation and Totex incentive mechanism.

Consequential adjustments

2.11. During the Annual Iteration Process, appropriate automatic adjustments are also made as a consequence of revisions to PCFM Variable Values. For example, in

some circumstances, as a result of automatic updates to the licensee's net debt and RAV figures under the Annual Iteration Process, updated equity issuance allowances could also be included in recalculated base revenue figures for the Formula Years concerned.

Atypical revisions

2.12. The GD1 Price Control Financial Methodologies describe the normal timing sequence for each PCFM Variable Value. For example, in relation to the driver for mains and services replacement expenditure (item 17 in Table 2.1) the normal sequence would be:

- activity level takes place in Formula Year t-2;
- activity level reported to Ofgem by 31 July in Formula Year t-1;
- revised PCFM Variable Value used in Annual Iteration Process to take place by 30 November in Formula Year t-1 (the variable value in the column equating to Formula Year t-2 on the PCFM Variable Values Table is the one which is revised, since that is when the activity level took place);
- incremental change to recalculated revenue position for Formula Year t-2 flows through to value of MOD_t ie it affects base revenue in Formula Year t.

2.13. A number of the special conditions provide for PCFM Variable Values to be directed for Formula Years outside the normal sequence. Where this is the case, the procedures are explained in the relevant methodologies in this handbook.

3. Pension allowances - financial adjustment methodologies

Part 1 - Overview

3.1. The opening base revenue allowances⁷ ('PU' values) for the licensee set down in the table at Appendix 1 to Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity) include allowances for:

- (a) Pension Scheme Established Deficit repair expenditure; and
- (b) Pension Scheme Administration and Pension Protection Fund (PPF) levy expenditure,

for each Formula Year of the price control period.

3.2. These allowances are represented, respectively, by the opening EDE and APFE values⁸ held in the PCFM Variable Values Table for the licensee, contained in the PCFM and are expressed in 2009-10 prices. Opening EDE and APFE values are based on modelling assumptions and parameters applicable at the outset of the price control period, consistent with Ofgem's pension principles (see paragraph 3.5 below).

3.3. The allowance levels will be updated during the price control period by revising EDE and APFE values for the purposes of the Annual Iteration Process for the PCFM. This chapter sets out:

- the reasons for updating allowances;
- the methodologies for determining revised EDE and APFE values;
- the expected timing of revisions; and
- the effect on the licensee's base revenue⁷ of revising EDE and APFE values for the Annual Iteration Process.

3.4. In the context of Pension Scheme Established Deficit repair and Pension Scheme Administration/PPF levy expenditure, we refer to 'allowances' rather than 'allowed expenditure'. This is because, subject to the reasonableness tests referred to in this chapter, EDE and APFE values are added in full to recalculated base revenue figures in the PCFM under the Annual Iteration Process – ie the amounts are treated as 100 per cent fast money⁹. It should be noted, however, that revisions to EDE and APFE values will have ancillary effects on other calculations under the Annual Iteration Process which also feed into recalculated base revenue figures.

⁷ 'Base Distribution Network Transportation Activity Revenue'

⁸ as at 1 April 2013

⁹ See Glossary

Price control pension principles

3.5. Ofgem's price control pension principles were set out in the March 2011 decision on strategy for the RIIO-GD1 price control¹⁰, together with the updated guidance notes in the Final Proposals, to which reference should be made. In summary, they include the following key points:

- customers should expect to fund the efficient cost of providing a competitive employment package including pensions costs in line with comparative benchmarks;
- customers should only fund the portion (of a wider group's pension costs) that is attributable to the gas transportation business;
- customers should not fund pension costs arising from a material failure of stewardship;
- pension costs should be assessed using actuarial methods, on the basis of reasonable assumptions in line with current best practice;
- under or over funding positions in preceding price control periods should be reflected in allowances, subject to being economic and efficient; and
- customers will not fund pension costs relating to severance arrangements.

Pension Scheme Established Deficit

3.6. For the purposes of Special Condition 3C (Specified financial adjustments) and this chapter, the term 'Pension Scheme Established Deficit' means the difference between the assets and corresponding liabilities within a defined benefit pension scheme, sponsored by the licensee, which are:

- attributable to the licensee's transportation business; and
- attributable to pensionable service up to and including 31 March 2013.

3.7. The proportion of a wider group pension scheme deficit which is attributable to the licensee's transportation business will be determined in accordance with the deficit allocation methodology published by Ofgem. This amount may be adjusted by Ofgem informed by the results of the reasonableness review.

3.8. Allowances for Pension Scheme Established Deficit repair are set at/revised to levels intended to allow the licensee to clear its Pension Scheme Established Deficit (by making payments to the pension scheme's trustees) over a 15 year period, beginning on 1 April 2013 (the Cut-Off date) and ending on 31 March 2028. The price control period ends on 31 March 2021, but EDE values will be determined having regard to the projected Pension Scheme Established Deficit repair completion date of 31 March 2028.

Pension Scheme Administration and PPF levy

¹⁰ <http://www.ofgem.gov.uk/Networks/GasDistr/RIIO-GD1/ConRes/Documents1/GD1decisionfinance.pdf>

3.9. For the purposes of Special Condition 3C and this chapter, Pension Scheme Administration means the range of activities that pension scheme trustees are required by legislation to undertake or commission in running the pension scheme. It includes, without limitation, the keeping of scheme records, scheme management and administration, scheme policy and strategy, the provision of information to scheme members, the calculation and payment of benefits and liaison with tax and regulatory authorities, and the preparation of valuations. It does not include investment management fees which are remunerated by deduction from investment returns or any activities which are the responsibility of the licensee, such as advisors to the licensee on managing or advising it on any and all aspects of its relationship with the trustees including recovery plans.

3.10. Pension Scheme Administration expenditure refers to payments made by the licensee to cover the proportion of Scheme Administration costs attributable to its transportation business.

3.11. The Pension Protection Fund charges an annual levy on eligible pension schemes. PPF levy expenditure refers to payments made by the licensee (or the pensions scheme) to cover the proportion of this levy attributable to its transportation business.

Costs and adjustments outside the scope of this chapter

Pension costs for service after 31 March 2013

3.12. Pension costs attributable to the licensee, but which relate to pensionable service on or after 1 April 2013 will be considered as a constituent part of labour costs for price control purposes. This includes annual funding costs relating to any incremental deficit which accrues in relation to such service, ascertained in accordance with the pension deficit allocation methodology. These costs therefore fall outside the scope of Special Condition 3C and this chapter.

True-up for pension payments by the licensee in the GDPCR price control period

3.13. For the price control period preceding RIIO-GD1 (the GDPCR price control), a true-up was applied to the difference between the level of pension costs included in the licensee's allowed revenues, and the actual payments made by the licensee to the pension scheme trustees. Any true-up amount not included in RIIO-GD1 opening base revenue allowances ('PU' values) will be dealt with in accordance with Special Condition 3A Legacy (price control adjustments) and chapter 10 of this handbook. Such adjustments therefore fall outside the scope of Special Condition 3C and this chapter.

Temporal conventions

3.14. For the purposes of Special Condition 3C and this chapter, "Formula Year t " means the Formula Year in which a value for the term MOD, calculated through a particular Annual Iteration Process, is used in the formula for the licensee's base

Distribution Network Transportation Activity Revenue¹¹. References to Formula t-1 etc should be construed accordingly.

3.15. A reference to, for example, 'the EDE value for 2015-16' means the EDE value in the 2015-16 column of the PCFM variable Values Table for the licensee contained in the PCFM.

Part 2 - Updating allowances through the Annual Iteration Process

3.16. The licensee's allowances for Pension Scheme Established Deficit repair and Pension Scheme Administration/PPF levy costs will be updated during the price control period to reflect:

- information contained in pension scheme actuarial valuation reports provided by the licensee to Ofgem; and
- actual deficit funding payments, pension scheme administration and PPF costs information contained in the licensee's price control review information submitted to Ofgem.

3.17. As set out in Special Condition 3C, EDE and APFE values will be revised on two occasions during the price control period, driven by the triennial scheme valuation cycle indicated in the timetable below.

¹¹ See Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity).

Table 3.1 - Expected timetable for EDE and APFE value revisions

| Actuarial defined benefit pension scheme valuation as at | Expected receipt of scheme valuation by Ofgem | Pension deficit allocation methodology information provided | Reasonableness of costs review completed | Revised EDE and APFE values directed for Annual Iteration Process no later than: | EDE values revised for Formula Year | APFE values revised for Formula Years |
|--|---|---|--|--|-------------------------------------|---------------------------------------|
| 31 March 2013 | June 2014 | 30 September 2014 | 31 October 2014 | 30 November 2014 | 2015-16 onwards | 2013-14, 2015-16 to 2018-19 |
| 31 March 2016 | June 2017 | 30 September 2017 | 31 October 2017 | 30 November 2017 | 2018-19 onwards | 2014-15 to 2020-21 |
| 31 March 2019 | June 2020 | 30 September 2020 | 31 October 2020 | n/a | n/a | n/a |

Note: The reasonableness review of the valuations as at 31 March 2019 will inform the reset and true up in RIIO-GD2.

3.18. For licensees whose scheme triennial valuation dates differ to those shown in the first column of Table 3.1, licensees are required to provide either a full valuation (provided it is also used to determine the schemes deficit recovery plan) or an updated valuation at these dates. The approach which should be used by licensees to produce an updated valuation is defined in Ofgem's pension deficit allocation methodology.

3.19. Ofgem will direct revised values for EDE and APFE values at other times, if that is necessary to reflect any revised timetable of information availability or process completion. However, in those circumstances, EDE and APFE values would still be determined in accordance with the procedures set out in this chapter.

3.20. As set out in paragraph 3.4, revised EDE and APFE values feed directly into the recalculated base revenue figures in the PCFM for applicable Formula Years through the Annual Iteration Process. Incremental changes to recalculated base revenue figures for years earlier than Formula Year *t* will, subject to a time value of money adjustment, be brought forward and reflected in the calculation of the term MOD to be directed for Formula Year *t*. For the avoidance of doubt, such a revision will not have any retrospective effect on a previously directed value of the term MOD.

Reasonableness review

3.21. In accordance with special licence condition 3C, after receiving each data set, or substantially all of each data set, of scheme valuations, Ofgem will commission a review of those valuations and of the reasonableness of the licensee's Pension Scheme Established Deficit funding levels. The expected completion times for the

reasonableness reviews due to take place during the price control period are shown in Table 3.1. The data set comprises:

- the actuarial valuation of the licensee's pension scheme(s), either a full valuation as at the date specified or an updated valuation of the last preceding full triennial valuation with the asset and liability values rolled forward as defined in the pensions deficit allocation methodology document;
- the schemes statement of funding principles;
- the schemes statement of investment principles; and
- the completed deficit allocation methodology tables and other pension data tables and supporting documents specified in the price control review cost information regulatory instructions and guidance (RIGs) document provided under standard special licence condition A40 (Regulatory Instructions and Guidance).

Part 3 – Established Deficit repair allowances

Determination and direction of revised EDE values by 30 November 2014

3.22. Subject to paragraph 3.24, revised EDE values will be determined by 30 November 2014 for each Formula Year from 2015-16 to 2020-21 using the methodology set out in Table 3.2 below.

Table 3.2 - Process for determining revised EDE values to be directed by 30 November 2014

| <u>Row</u> | <u>Timing</u> | <u>Event</u> | <u>Value</u> |
|------------|----------------------|---|--------------|
| 1 | By 30 June 2014 | Ofgem obtains the actuarial scheme valuation for the licensee's defined benefit pension scheme as at 31 March 2013 and commences a reasonableness review. | |
| 2 | By 31 July 2014 | Ofgem receives price control review information from licensee covering Formula Year 2013-14. | |
| 3 | By 30 September 2014 | Licensee submits deficit allocation information and indicative Pension Scheme Established Deficit figure for 31 March 2013. | |
| 4 | By 31 October 2014 | Ofgem carries out reasonableness review of information submitted by licensee and determines Cut-Off Date Pension Scheme Established Deficit position as at 31 March 2013. | "A" |
| 5 | | Cut-Off Date Pension Scheme Established Deficit amount deflated to 2009-10 prices using actual RPI data | "B" |

| | | | |
|--|--------------------------|---|-----|
| | | determined in accordance with paragraph 1.6. | |
| 6 | By 31 October 2014 | Remaining deficit repair period established as 13 years (2027-28 minus 2014-15). | |
| 7 | | <p>Annual Pension Scheme Established Deficit repair allowance in 2009-10 prices computed as:</p> $= "B" / ((1-(1+DR)^{-13}) / \ln(1+DR))$ <p>Where:</p> <p>DR is the discount rate determined by Ofgem derived through a benchmarking process against energy network operators pre-retirement discount rates as applied in their valuations at step 1 and moderated against similar rates reported for occupational pension schemes in Great Britain; and</p> <p>LN returns the natural logarithm of the subject value.</p> <p>If there is a surplus shown by the valuation, B and C are set to zero and paragraph 3.25 below applies.</p> | "C" |
| Adjustment relating to licensee payment history in RIIO-GD1 period | | | |
| 8 | By 31 October 2014 | <p>Obtain actual deficit repair payment attributable to the licensee:</p> <ul style="list-style-type: none">a) Obtain relevant portion attributable to the licensee's distribution business of the actual deficit repair payments in 2013-14.b) Adjust for any disallowed costs arising from Ofgem's reasonableness review.c) Deflate to 2009-10 prices using actual RPI data determined in accordance with paragraph 1.6d) Where the licensee has taxable profits in the year, deduct the value of corporation tax to give the post-tax value of deficit repair payments. This is calculated at the actual rate of corporation tax applicable to Formula Year 2013-14. If the licensee does not have taxable profits for the year, this step is omitted.e) Adjust for the time value of money through to the date where EDE allowance values will be revised, ie 1 April 2015. <p>This is computed as:</p> $= (ED - DC) * (RPI_{2009-10} / RPI_{nominal}) * (1 - CT) * (1 + WACC)^n$ | "D" |

| | | | |
|---|--|--|--|
| | | <p>Where:</p> <p>"ED" is the licensee portion of established deficit repair payments during 2013-14 in 2009-10 prices;</p> <p>"DC" is the value of disallowed costs arising from Ofgem's reasonableness review;</p> <p>"RPI₂₀₀₉₋₁₀" means the arithmetic average of the Retail Prices Index (all items) figures published by the Office for National Statistics for each calendar month in Formula Year 2009-10 rounded to three decimal places;</p> <p>"RPI_{nominal}" means the arithmetic average of the Retail Prices Index (all items) figures published by the Office for National Statistics for each calendar month in the Formula Year referred to in the price control review information in question rounded to three decimal places;</p> <p>"CT" is the actual rate of Corporation Tax applicable in Formula Year 2013-14, or is zero if the licensee does not have taxable profits for the year</p> <p>"WACC" is the Vanilla Weighted Average Cost of Capital attributable in Formula Year 2013-14; and</p> <p>"n" is the number of financial years to 1 April 2015.</p> | |
| 9 | | <p>Obtain pre-existing EDE allowances for comparison to licensee's actual deficit repair payment:</p> <p>a) Obtain pre-existing EDE allowances as set out in Final Proposals (EDEFP);</p> <p>b) Adjust the pre-existing EDE allowances set out in Final Proposals to the post-tax value (1-CT); and</p> <p>c) Adjust for the time value of money $(1+WACC)^n$.</p> <p>This is computed as:</p> $= (EDEFP * (1 - CT) * (1 + WACC)^n$ <p>Where:</p> <p>"EDEFP" is the pre-existing EDE allowance set out in Final Proposals;</p> <p>"CT" is the actual rate of Corporation Tax applicable in Formula Year 2013-14, or is zero if the licensee does not have taxable profits for the year;</p> <p>"WACC" is the Vanilla Weighted Average Cost of Capital</p> | |

| | | | |
|----|--|---|-----|
| | | <p>attributable in Formula Year 2013-14; and</p> <p>"n" is the number of financial years to 1 April 2015.</p> | |
| 10 | | <p>Obtain the difference between the pre-existing allowance and actual payment.</p> <p>This is computed as: "D" – "E".</p> | "F" |
| 11 | | <p>Spread the difference between the pre-existing allowance and actual payment evenly over the remaining 13 years of the notional 15-year funding period:</p> <p>The adjusting amount relating to each Formula Year is computed as (in 2009-10 prices):</p> $= \text{value "F"} / ((1-(1+DR)^{-13}) / \text{LN}(1+DR))$ <p>Where:</p> <p>DR is the discount rate determined using the methodology described in row 7.</p> <p>The value "G" may be either positive (if actual payments at "D" are greater than the pre-existing allowance), or negative (if actual payments at "D" are less than the pre-existing allowances).</p> | "G" |
| 12 | | <p>Obtain revised EDE values for the remaining years of RIIO-GD1, ie for each Formula Year from 2015-16 to 2020-21.</p> <p>This is determined as: "C" + "G".</p> <p>Note 2015-16 will remain the first Formula Year in the event that the adjustment is delayed by one or more years.</p> | |

3.23. The adjustment contained in Row 10 of Table 3.2 deals with a situation where the licensee has previously paid across more, or less, than the allowance (EDE value) it was given for a particular Formula Year.

Scheme surplus

3.24. If the difference between the assets and corresponding liabilities referred to in paragraph 3.6 represents a surplus position as at 31 March 2013, then EDE values for Formula Years from 2015-16 onwards will be revised to zero pending the next review process set out in Table 3.3. The policy position with regard to pension

scheme surpluses is set out in the March 2011 Strategy document and, as applicable, the relevant Final Proposals.

Determination and direction of revised EDE values by 30 November 2017

3.25. Subject to paragraph 3.27, revised EDE values will be determined by 30 November 2017 for each Formula Year from 2018-19 to 2020-21 using the methodology set out in Table 3.3 below.

Table 3.3 - Process for determining revised EDE values to be directed by 30 November 2017

| Row | Timing | Event | Value |
|-----|----------------------|---|-------|
| 1 | By 30 June 2017 | Ofgem obtains the actuarial scheme valuation for the licensee's defined benefit pension scheme(s) as at 31 March 2016 and commences a reasonableness review. | "A" |
| 2 | By 31 July 2017 | Ofgem receives price control review information from licensee covering Formula Years 2014-15, 2015-16 and 2016-17. | |
| 3 | By 30 September 2017 | Licensee submits deficit allocation information and indicative Pension Scheme Established Deficit figure. | |
| 4 | By 31 October 2017 | Ofgem carries out reasonableness review of information submitted by licensee and determines Cut-Off Date Pension Scheme Established Deficit position as at 31 March 2016. | |
| 5 | | Cut-Off Date Pension Scheme Established Deficit amount deflated to 2009-10 prices using actual RPI data determined in accordance with paragraph 1.6. | "B" |
| 6 | | Remaining deficit repair period established as 10 years (2027-28 minus 2017-18). | |
| 7 | | Annual Pension Scheme Established Deficit repair allowance in 2009-10 prices computed as: $= "B" / ((1-(1+DR)^{-10}) / \ln(1+DR))$ <p>Where: "DR" is the discount rate determined by Ofgem derived through a benchmarking process against energy network operators pre-retirement discount rates as applied in their valuations at "A" and moderated against similar rates reported by occupational pension schemes in Great Britain; and</p> | "C" |

| | | | |
|--|--------------------|---|-----|
| | | <p>"LN" returns the natural logarithm of the subject value.</p> <p>If there is a surplus shown by the valuation, B and C are set to zero and paragraph 3.27 below applies.</p> | |
| Adjustment relating to licensee payment history in RIIO-GD1 period | | | |
| 8 | By 31 October 2017 | <p>Obtain actual deficit repair payment attributable to the licensee:</p> <ul style="list-style-type: none"> a) Obtain relevant portion attributable to the licensee's distribution business of the actual deficit repair payment made by licensee in 2014-15, 2015-16, and 2016-17. b) Adjust for any costs identified in Ofgem's reasonableness review, based on valuation data as at 31 March 2016 (ED). c) Deflate to 2009-10 prices using actual RPI data determined in accordance with paragraph 1.4 (DC). d) Where the licensee has taxable profits in the year, deduct the value of corporation tax to give the post-tax value of deficit repair payments. This is calculated at the actual rate of corporation tax applicable to the relevant Formula Year. If the licensee does not have taxable profits for the year, this step is omitted (1-CT). e) Adjust for the time value of money through to the date where EDE allowance values will be revised, ie 1 April 2018 (1+WACCⁿ). <p>This is computed for each Formula Year as:</p> $= (ED - DC) * (RPI_{2009-10} / RPI_{nominal}) * (1-CT) * (1+WACC)^n$ <p>eg $D_{2014-15} = (ED_{2014-15} - DC_{2014-15}) * (RPI_{2009-10} / RPI_{2014-15}) * (1-CT_{2014-15}) * (1 + WACC_{2014-15})^4$</p> <p>Repeat for $D_{2015-16}$ and $D_{2016-17}$</p> <p>The value of "D" is:</p> $"D" = D_{2014-15} + D_{2015-16} + D_{2016-17}$ <p>Where:</p> <p>"ED" is the licensee portion of established deficit repair payments during the relevant Formula Year, in 2009-10 prices;</p> <p>"DC" is the value of disallowed costs arising from Ofgem's</p> | "D" |

| | | | |
|---|--|--|-----|
| | | <p>reasonableness review, based on valuation data as at 31 March 2016;</p> <p>"RPI₂₀₀₉₋₁₀" means the arithmetic average of the Retail Prices Index (all items) figures published by the Office for National Statistics for each calendar month in Formula Year 2009-10 rounded to three decimal places;</p> <p>"RPI_{nominal}" means the arithmetic average of the Retail Prices Index (all items) figures published by the Office for National Statistics for each calendar month in the Formula Year referred to in the price control review information in question rounded to three decimal places;</p> <p>"CT" is the actual rate of Corporation Tax applicable in the relevant Formula Year, or is zero if the licensee does not have taxable profits for the year; and</p> <p>"WACC" is the Vanilla Weighted Average Cost of Capital attributable in each Formula Year; and</p> <p>"n" is the number of financial years to 1 April 2018.</p> | |
| 9 | | <p>Obtain pre-existing EDE allowances for comparison to licensee's actual deficit repair payment:</p> <p>a) Adjust the pre-existing EDE allowances reset at 1 April 2015 to the post-tax value; and</p> <p>b) Adjust for the time value of money.</p> <p>This is computed for each Formula Year as:</p> $= (EDE1 * (1 - CT)) * (1 + WACC)^n$ <p>eg $E_{2014-15} = EDE1 * (1 - CT_{2014-15}) * (1 + WACC_{2014-15})^4$</p> <p>Repeat for $E_{2015-16}$ and $E_{2016-17}$</p> <p>The value of "E" is computed as:</p> $"E" = E_{2014-15} + E_{2015-16} + E_{2016-17}$ <p>Where:</p> <p>"EDE1" is the pre-existing EDE annual allowance reset at 1 April 2015, before any true-up adjustment (ie value "C" in table 3.2);</p> <p>"CT" is the actual rate of Corporation Tax applicable in the relevant Formula Year, or is zero if the licensee does not have taxable profits for the year;</p> <p>"WACC" is the Vanilla Weighted Average Cost of Capital attributable in each Formula Year; and</p> | "E" |

| | | | |
|----|--|---|-----|
| | | "n" means the number of financial years to 1 April 2018. | |
| 10 | | Obtain the difference between the pre-existing allowance and actual payment. This is computed as: "D" – "E". | "F" |
| 11 | | Spread the difference between the pre-existing allowance and actual payment evenly over the remaining 10 years of the notional 15-year funding period. The adjusting amount relating to each Formula Year is computed as (in 2009-10 prices): = value "F" / ((1-(1+DR) ⁻¹⁰) / LN(1+DR)) Where: DR is the discount rate determined using the methodology set out in row 7. The value "G" may be either positive (if actual payments at "D" are greater than the pre-existing allowance), or negative (if actual payments at "D" are less than the pre-existing allowances). | "G" |
| 12 | | Obtain revised EDE values for the remaining years of RIIO-GD1, ie for each Formula Year from 2018-19 to 2020-21. This is determined as: "C" + "G". | |

3.26. The adjustment contained in Row 10 of Table 3.3 deals with a situation where the licensee has previously paid across more, or less, than the allowance (EDE value) it was given for a particular Formula Year.

Scheme surplus

3.27. If the difference between the assets and corresponding liabilities referred to in paragraph 3.6 represents a surplus position as at 31 March 2016, then EDE values for Formula Years from 2018-19 onwards will be revised to zero pending the next triennial determination. The policy position with regard to pension scheme surpluses is set out in Ofgem's pension principles in the March 2011 Strategy document and, as applicable, the relevant Final Proposal.

Direction of revised EDE values

3.28. The Authority will direct revised EDE values by no later than 30 November 2014 and 30 November 2017 in accordance with the procedure set out in Part D of Special Condition 3C.

Part 4 - Pension Scheme Administration and PPF levy allowances

3.29. The licensee's actual costs in respect of scheme administration costs and PPF levies will be reported under the annual Regulatory Reporting cycle in accordance with Standard Special Condition A40 (Price Control Review Information) of the licence.

3.30. Revised APFE values will be determined in accordance with the steps set out below by 30 November 2014 and 30 November 2017.

Values to be directed by 30 November 2014

- (i) The actual aggregated Pension Scheme Administration and PPF levy expenditure reported by the licensee in its price control review information submissions for Formula Year 2013-14 will be obtained.
- (ii) The expenditure amounts in (i) will be deflated to 2009-10 prices using actual RPI data.
- (iii) The aggregate price control allowance for Pension Scheme Administration and PPF levy expenditure for that year set out in the relevant Final Proposals is obtained, to which is added the annual adjustment threshold amount of £1m.
- (iv) If the amount referred to in step (iii) is exceeded in any specified Formula Year by the amount in step (ii), the excess amount only will be added to the pre-existing amount allowance at the price control for that item.
- (v) If the amount at (ii) is less than the pre-existing price control allowed value at (iii), then no revision to the price control value will be made.
- (vi) The excess at (iv) will be added to the pre-existing APFE value to determine the revised APFE value for Formula Year 2013-14.
- (vii) Ofgem will review Pension Scheme Administration and PPF levy costs based on actual costs incurred in previous years and known changes to the PPF levies advised by the PPF and, subject to them being considered efficient, reset the existing constituent costs and will also review the combined existing APFE values for Formula Years 2015-16, 2016-17 and 2017-18.

Values to be directed by 30 November 2017

- (i) The actual aggregated Pension Scheme Administration and PPF levy expenditure reported by the licensee in its price control review information submissions for Formula Years 2014-15, 2015-16 and 2016-17 will be obtained.
- (ii) The expenditure amounts in (i) will be deflated to 2009-10 prices using actual RPI data.

- (iii) The aggregate price control allowance for Pension Scheme Administration and PPF levy expenditure for that year set out in the relevant Final Proposals is obtained, to which is added the annual adjustment threshold amount of £1m.
- (iv) If the amount referred to in step (iii) is exceeded in any specified Formula Year by the amount in step (ii), the excess amount only will be added to the pre-existing amount allowance at the price control for that item.
- (v) If the amount at (ii) is less than the pre-existing price control allowed value at (iii), then no revision to the price control value will be made.
- (vi) The excess at (iv) will be added to the pre-existing APFE values to determine the revised APFE values for Formula Years 2014-15, 2015-16 and 2016-17.
- (vii) Ofgem will review Pension Scheme Administration and PPF levy costs based on actual costs incurred in previous years and known changes to the PPF levies advised by the PPF and, subject to them being considered efficient, reset the existing constituent costs and will also review the combined existing APFE values for Formula Years 2018-19, 2019-20 and 2020-21.

Direction of revised APFE values

3.31. The Authority will direct revised APFE and SOAFPE values no later than 30 November 2014 and 30 November 2017 respectively as computed above in accordance with the procedure set out in Part D of Special Condition 3C.

Part 5 - Processing of revised EDE and APFE values under the Annual Iteration Process

3.32. EDE and APFE values, as revised are added in full to recalculated base revenue figures in the PCFM under the Annual Iteration Process and are treated as 100 per cent fast money. Revisions to EDE and APFE values will have ancillary effects on other calculations under the Annual Iteration Process which also feed into recalculated base revenue figures.

3.33. Incremental changes to recalculated base revenue figures for years earlier than Formula Year *t* will, subject to a time value of money adjustment, be brought forward and reflected in the calculation of the term MOD to be directed for Formula Year *t*. For the avoidance of doubt, such a revision will not have any retrospective effect on a previously directed value of the term MOD.

3.34. EDFE and APFE values are not added to RAV and are not subject to the Totex Incentive Mechanism.

4. Tax liability allowances - financial adjustment methodologies

Part 1 - Overview

4.1. The opening base revenue allowances ('PU' values) for the licensee set down in the table at Appendix 1 to Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity) include tax liability allowances which are modelled at the outset of the price control period to take account of:

- (a) existing and announced corporation tax rates and writing down allowance rates;
- (b) existing legislation, case law, accounting standards and HM Revenue & Customs (HMRC) policy; and
- (c) modelled levels of gearing and corporate debt interest payments.

4.2. Part B of Special Condition 3C provides for adjustments to be made to the licensee's tax liability allowances¹² during the price control period through the Annual Iteration Process for the GD1 Price Control Financial Model. Changes to the factors referred to at sub-paragraphs 4.1(a) and (b) are referred to as 'tax trigger events' and the methodology for adjustments is set out in Part 2 of this chapter. Changes in respect of the factors referred to at sub-paragraph 4.1(c) are referred to as 'tax clawbacks' and the methodology for adjustments is set out in Part 3 of this chapter.

Temporal conventions

4.3. For the purposes of Special Condition 3C and this chapter, "Formula Year t" means the Formula Year in which a value for the term MOD, calculated through a particular Annual Iteration Process, is used in the formula for the licensee's base Distribution Network Transportation Activity Revenue¹³.

Annual Iteration Process

4.4. The updating of the licensee's tax liability allowances and regulatory tax losses balance is carried out through the Annual Iteration Process for the PCFM. The Variable Values Table for the licensee contained in the PCFM contains rows for PCFM Variable Values for tax liability allowance adjustments driven by:

¹² References in this chapter to tax liabilities are references to liabilities for corporation tax only and not to any other type of taxation.

¹³ See Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity).

- tax trigger events ('TTE' values); and
- tax clawbacks ('TGIE values').

4.5. TTE and TGIE values represent £m amounts. As at 1 April 2013, the TTE and TGIE values for the licensee, for each Formula Year will be zero. Part B of Special Condition 3C (Specified financial adjustments) provides for any revisions to TTE and TGIE values to be directed after determination under the methodologies in this chapter.

4.6. Revisions to TTE and TGIE values feed into the recalculated base revenue figures and/or the regulatory tax loss balances for applicable Formula Years in the GD1 PCFM, through the Annual Iteration Process. Incremental changes to recalculated base revenue figures for years earlier than Formula Year t are, subject to a time value of money adjustment, brought forward and reflected in the calculation of the term MOD to be directed for Formula Year t. For the avoidance of doubt, such changes will not have any retrospective effect on a previously directed value of the term MOD.

4.7. It should be noted that underlying tax liability allowances for the licensee within the PCFM might also be changed under the Annual Iteration Process as a consequence of other variable value changes, such as increases in allowed Totex expenditure. However, these changes are distinct from the specific adjustments to tax liability allowances under the methodologies in this chapter. The allocation assumptions of the component elements of allowed Totex expenditure to capital allowance pools and revenue in the PCFM as set out in the Final Proposals will not be updated in the price control period.

Price bases for tax calculations

4.8. The PCFM works in constant 2009-10 prices, with all inputs and outputs in this price base. Where applicable, financial amounts which are expressed in later, nominal prices, will be deflated to 2009-10 prices on the basis of actual RPI data before being used to determine revised TTE and TGIE values.

4.9. The PCFM uses nominal prices for some internal tax calculation functions. For this purpose, the model refers to RPI forecast values set at the outset of the price control period and hard coded into the model.

Regulatory tax losses

4.10. In some instances, the approach to calculating tax liability allowances could imply that the licensee should receive a negative allowance. In such cases, the price control treatment is to model a zero allowance; and the value of the tax loss will be added to the 'regulatory tax loss', where it exists, and will be carried forward to be offset against future any tax liability allowances. The regulatory tax loss balance attributable to each Formula Year (together with a running total) is held within the PCFM and regulatory tax losses are referred to where applicable in the methodologies in this chapter.

Group tax arrangements

4.11. For the purposes of the methodology set out in Part 2 of this chapter, tax liabilities, allowances and trigger events are considered on a notional 'licensee business' basis, and consequently the following are disregarded in the assessment of tax liabilities and allowances for price control purposes:

- the claim or surrender of group tax relief (including consortium relief);
- interest payments (including any coupon on any debt instrument or preference share dividend) and receipts which are not tax deductible or chargeable under HMRC rules for the purposes of computing the licensee's taxable profits, including but not limited to adjustments for transfer pricing and the "worldwide" debt cap; and
- any other adjustments required in appendix 1 of the July 2009 decision letter.

4.12. For the purposes of the methodology set out in Part 3 of this chapter, levels of debt, interest and gearing are considered at licensee level or, for National Grid Gas each of its distribution networks level, as opposed to any other level with respect to the corporate or ownership group of which the licensee is a member.

Part 2 - Adjustments driven by tax trigger events - methodology

4.13. The methodology set out in this Part provides for the licensee's tax liability allowances to be updated (subject to a threshold described below) to take account of tax trigger events. This means that consumers will derive a benefit when tax liability costs fall materially, and the licensee will be appropriately reimbursed when they rise.

Tax trigger events

4.14. There are two types of tax trigger event for the purposes of tax liability allowance adjustments:

Type A

Type A events consist of:

- changes to corporation tax rates, applicable to one or more Formula Years; and
- changes to capital allowance rates applicable to one or more Formula Years.

Type B

Type B events consist of other factors (exogenous to the licensee, its owners or controllers) which cause a change to the licensee's notional tax liabilities for one or more Formula Years including:

- changes to applicable legislation;
- the setting of legal precedents through case law;
- changes to HMRC interpretation of legislation; and
- changes in accounting standards, including any deferral of the Accounting Standard Board's (ASB) implementation date for Financial Reporting Exposure Draft 48 (FRED48)¹⁴.

4.15. Where a Type B event changes the allocation of allowable expenditure into different or introduces new capital allowance pools, the model will only be updated for the scale of the change driven by the policy. The applicable allocation and allowance rates will be adjusted to take into account the new expected allocation basis from the introduction of a new capital allowance pool or pools. There is no adjustment of allocations to licensee's actual allocations for Formula Years up to the date of the change. We will work with licensees to quantify changes allocations where these are not straight forward.

4.16. Type B events will only be taken into account where the licensee has demonstrably used all reasonable endeavours to minimise any increase in its tax liabilities.

Materiality threshold and 'deadband'

4.17. A materiality threshold is applied to tax trigger events during the price control period and a £m threshold amount for each Formula Year is included amongst the fixed values on the Tax Trigger sheet for the licensee in the PCFM.

4.18. The materiality threshold for each Formula Year is fixed for the period of the price control. The threshold is determined as the greater of:

- 0.33 per cent of opening base revenue allowances ('PU' values) for the licensee set down in the table at Appendix 1 to Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity); and
- the effect of a one per cent change in the rate of corporation tax,

on the opening values of the PU term for each Formula Year.

¹⁴ FRED48 The Financial Reporting Standard applicable to UK and Republic of Ireland published by ASB January 2012, which is expected to become FRS102

4.19. A change to tax liability allowances for a particular Formula Year is only applied where one or more trigger events result in a change to the licensee's tax liabilities for that year (upward or downward) by an amount which is greater than the threshold amount. Furthermore, any change to the tax liability allowance (upward or downward) is limited to the amount which is in excess of the threshold amount for the year concerned.

4.20. Where the change to the licensee's tax liabilities for a particular Formula Year is below the threshold, subsequent tax trigger events, relating back to that Formula Year could cause the threshold amount to be exceeded. In that case, a change to the licensee's tax liability allowance for the Formula year concerned (a revised TTE value) would be determined once the threshold has been exceeded.

4.21. For the avoidance of doubt, a regulatory tax loss figure attributable to a particular Formula Year is not taken into account for the purposes of deciding whether the threshold amount has been exceeded for that year.

Accounting standards

4.22. The licensee's tax liability calculations are subject to:

- specific legislative requirements;
- case law;
- HMRC interpretation of legislation; and
- changes in accounting standards, including any deferral of the Accounting Standard Board's (ASB) implementation date for Financial Reporting Exposure Draft 48 (FRED48)¹⁵ requirements of the accounting framework applicable to preparation of the licensee's statutory accounts¹⁶

4.23. The accounting frameworks to be applied by the licensee for the purpose of computing tax liabilities are:

- UK GAAP in respect of Formula Years 2013-14 and 2014-15; and
- for each subsequent Formula Year either:
 - EU-IFRS, if adopted for use by the licensee; or
 - UK GAAP (under Financial Reporting Standard 102, as it should be known as on the implementation of FRED48).

Notification of tax trigger events

¹⁵ FRED48 The Financial Reporting Standard applicable to UK and Republic of Ireland published by ASB January 2012, which is expected to become FRS102

¹⁶ Section 385 of the Companies Act 2006 refers.

Type A trigger events

4.24. Ofgem will, by 30 September in each Formula Year t-1, notify the licensee of the Type A trigger events which it proposes to take into account in determining any revised TTE values for use in the Annual Iteration Process that is required to take place by 30 November in that same Formula Year t-1. It is, however, open to the licensee to contact Ofgem in advance of 30 September in each Formula Year to discuss the current view of Type A events. If Ofgem does not notify the licensee by 30 September in any year, the adjustments will be made in the subsequent year.

4.25. The notification from Ofgem will specify the corporation tax rate change(s) or changes to rates of capital allowances concerned and the Formula Years to which they relate.

4.26. If, after receiving the notification referred to in paragraph 4.24, the licensee considers that a Type A trigger event has occurred, which has not been included in the notification, it should contact Ofgem within 14 days and provide details of the event concerned. If Ofgem agrees that a further Type A trigger event has occurred, it will notify the licensee by 31 October in the same Formula Year t-1.

4.27. If any Type A trigger event is left out of account when it ought to have been included in the determination of a revised TTE value (either because it was not included in a notice or otherwise) the position will be rectified in a subsequent revision of the TTE value(s) concerned. In such a case, the functionality of the PCFM means that a time value of money adjustment would be applied.

Type B trigger events

4.28. The licensee must notify Ofgem by 30 September in each Formula Year t-1 of all the Type B trigger events that it becomes aware of, except those which have been previously reported. This requirement applies equally to events which could be expected to increase or to reduce the licensee's tax liability allowances.

4.29. If the licensee fails to notify Ofgem of any events it becomes aware, or should be aware of, which potentially or actually increases in the licensee's tax liability it will not be made retrospective nor made PV neutral. If the failure relates to a reduction or increase in the licensee's tax liability, then subject to the licensee demonstrating that it uses all reasonable endeavours to identify all Type B trigger events this may not be held a breach of the licence conditions. We will deal with each event on its merits on a case-by-case basis.

4.30. The notification referred to in paragraph 4.28 should include, in respect of each Type B trigger event:

- (a) a description of the event;
- (b) the change in tax liabilities which the event is considered to cause and the Formula Years to which they relate;

- (c) the calculations (including all relevant parameters and values) which the licensee used to arrive at the amounts referred to in sub-paragraph (b);
- (d) any relevant information provided by HMRC in relation to the event;
- (e) evidence of mitigating measures which the licensee has taken to minimise any additional liabilities arising from the event; and
- (f) whether the licensee agrees or disagrees with HMRC, whether they may contest it; and how they intend to report it in the tax submissions.

4.31. The licensee's notification should also state whether the licensee considers that the materiality threshold (see paragraph 4.17) has been exceeded for the Formula Year(s) concerned, taking into account the total net amount of tax liability changes (upward and downward) included in the current notification and any previous notifications.

4.32. Ofgem will review any notifications given to it by the licensee under paragraph 4.28 and may ask the licensee:

- for additional information in respect of one or more of the notified events; and/or
- to submit the results of limited scope audit procedures, specified by Ofgem and carried out by the licensee's appropriate auditors¹⁷, to assist in confirming the appropriateness and accuracy of the licensee's calculations.

4.33. Ofgem will inform the licensee by 31 October in the same Formula Year t-1 whether, in respect of each Type B trigger event:

- it has agreed the change in tax liabilities figure calculated by the licensee;
- it has determined a different change in tax liabilities figure from that calculated by the licensee; or
- it has decided that consideration of any change in tax liabilities should be deferred until further/better information is available.

4.34. Where Ofgem determines a different change in tax liabilities figure from that calculated by the licensee or decides that consideration of any change in tax liabilities should be deferred, it will set out its reasons and/or calculations. The licensee has the right to reply setting out its objections, which Ofgem must consider.

4.35. Ofgem will also notify the licensee by 31 October in each Formula Year t-1, of any Type B trigger events that it proposes to take into account but which have not been included in a notification sent to Ofgem by the licensee. The licensee has the right to reply setting out its objections, which Ofgem must consider.

¹⁷ As defined in Standard Special Condition A3 of the Gas Transporter Licence

4.36. The final quantification and adjustment for any type B trigger event will be deemed to have occurred when the licensee and HMRC conclude the agreement of the licensee's tax liabilities for the relevant Formula Year concerned. This means that the final quantification will typically either confirm a prior value of TTE or revise a value of TTE for a year t-2 or earlier. The adjustment to TTE values will be directed in accordance with paragraphs 4.42 and 4.44.

Logging of trigger events

4.37. Ofgem will keep a log of tax trigger events which have been subject to notifications by it or by licensees showing for each event:

- a description of the event and whether it was Type A or Type B;
- the name of the party who notified the event (Ofgem or licensee);
- the date of notification;
- the amount of any change in the licensee's tax liabilities which has been determined under the procedures set out below; and
- details of any events for which a determination is in abeyance and a description of the outstanding actions to be taken.

Determination and direction of revised TTE values

Determination of revised TTE values using the tax trigger calculation tool

4.38. The design of the PCFM includes additional functionality meaning that a copy of the PCFM (held on Ofgem's website) can be used as a tax trigger calculation tool, as an adjunct to the Annual Iteration Process.

4.39. After 31 October in each Formula Year t-1, Ofgem will generate a duplicate copy of the PCFM, in its state following the last completed Annual Iteration Process (but including any subsequent functional modifications under Special Condition 2A) for use as the tax trigger calculation tool. It will then take the following steps to determine TTE values for each licensee:

- (i) all of the other PCFM Variable Value revisions which have been determined for use in the prospective Annual Iteration Process (and which Ofgem expects to include in the notices of proposed Variable Value revisions to licensees) will be applied to the Variable Values Table;
- (ii) all of the existing TTE values will be re-set to zero;
- (iii) any existing values in the yellow input cells on the tax trigger worksheet will be cleared with the exception of the tax deadband values;
- (iv) the 'Tax allowance before tax trigger' amount for the licensee for each Formula Year shown on the tax trigger worksheet will be noted;
- (v) the PCFM copy will be put into 'tax trigger tool mode' using the selector on the User Interface worksheet;

- (vi) changes to corporation tax rates or writing down allowance rates (reflecting Type A trigger events) will be input into the yellow input cells in the appropriate rows and Formula Year columns on the tax trigger worksheet;
- (vii) the tax trigger macro calculation programmed into the workbook will be run;
- (viii) the aggregate changes to the licensee's tax liabilities determined in respect of all Type B trigger events (whether notified during Formula Year t-1 or on an earlier occasion) will be input into the yellow input cells on the 'Type B event values' row in the appropriate Formula Year columns on the tax trigger worksheet;
- (ix) the tax trigger macro calculation will be re-run;
- (x) the new 'Tax allowance' amount for the licensee shown on the tax trigger worksheet will be noted – this is displayed net of the deadband amount which is a fixed input amount for each year;
- (xi) the difference between the 'Tax allowance before tax trigger' referred to at point (iv) and the new 'Tax allowance' referred to at point (x) will be calculated as a £m amount, for the licensee for each Formula Year.

4.40. Subject to paragraph 4.41, the amounts calculated under step (xi) will then be determined to be the TTE values for the licensee for each Formula Year. Where these values differ from the TTE values shown on the Variable Values Table for the licensee in the PCFM (following the last completed Annual Iteration Process), Ofgem will direct that the TTE values concerned are to be changed in accordance with the process set out in Part B of Special Condition 3C and referred to below.

4.41. The process set out in paragraph 4.39 will be re-performed, if any of the PCFM Variable Values, referred to at step (iii) are changed, to ensure that accurate TTE values are available for the Annual Iteration Process.

Notes on the tax trigger calculation

- The two stage calculation process referred to in steps (vii) and (ix) allows the tax trigger calculation tool to take full account of the interrelationship between Type A and Type B events.
- The nullification of existing TTE values referred to in step (ii) together with the inclusion of all determined changes to the licensee's tax liabilities referred to in step (viii) ensures that the determination of TTE values under step (xi) is on a consistent basis and accurately applies the materiality threshold/deadbanded applicable to each Formula Year.
- The inclusion of all available revisions to other PCFM Variable values under step (i) ensures that the tax allowance calculation is as up to date as possible for each Formula Year.
- Once a tax trigger event has occurred in any prior year, the tax trigger calculation will need to be run in all subsequent years, even if no tax trigger event occurs in the year of running the calculation.

Direction of revised TTE values

4.42. The Authority will direct any revisions to TTE values for the licensee by 30 November in each Formula Year $t-1$, having given the licensee at least 14 days notice of the values which it proposes to direct.

4.43. Revised TTE values can be directed in respect of a particular Annual Iteration Process for any Formula Year during the price control period, including for years later than year t .

4.44. The procedure for the Authority's direction of revised TTE values is set out in Part D of Special Condition 3C.

Part 3 - Adjustments driven by gearing levels and corporate debt interest costs ('tax clawback') - methodology

4.45. At the outset of the price control period, modelling assumptions are made about financing requirements, gearing levels and corporate debt costs for the licensee's business. These result in modelled levels of tax deductible interest costs and tax relief for the licensee.

4.46. If the licensee operates at a higher level of gearing than the modelled level, it stands to benefit from the tax value of higher levels of deductibility. We apply a mechanism which 'claws back' this benefit for consumers by updating the licensee's tax liability allowances using the methodology set out in this Part. It should be noted that there is no provision to give additional tax allowances to the licensee if it chooses to operate at a level of gearing lower than the modelled one.

Determination and direction of revised TGIE values

4.47. As a function of each Annual Iteration Process of the PCFM, for each year in the period 2013-14 to 2010-21 inclusive, updated figures for the expected amount of tax deductible interest payable by the licensee is calculated. These are shown as core and non-core elements in the Finance and Tax worksheet.

4.48. After 31 October in each Formula Year, Ofgem will obtain the most recently modelled figure for tax deductible interest payable by the licensee in Formula Year $t-2$, and all prior years from a copy of the PCFM, in its state following the last completed Annual Iteration Process (but including any functional modifications under Special Condition 2A).

4.49. The licensee is required to submit its price control cost reporting pack by 31 July in each Formula Year $t-1$ ¹⁸, in accordance with standard special condition A40

¹⁸ Subject to any changes to Standard Special Condition A40 (Price Control Review Information)

(Price Control Review Information) of the gas transporter's licence and the Price Control Cost Reporting Rules: Instructions & Guidance ('RIGs') issued under that condition.

4.50. Ofgem will obtain from the 'tax clawback data table' in that submission:

- (i). the licensee's view of adjusted net debt figure as at 31 March in Formula Year t-2 for the purposes of this calculation; and
- (ii). the adjusted amount of tax deductible net interest payable by the licensee during Formula Year t-2, measured on an accruals basis.

4.51. The criteria, which the licensee must observe in reporting each of these adjusted items, are set out in the decision letter dated 31 July 2009 and Ofgem reviews the licensees reporting in this regard.

4.52. Ofgem will obtain from the PCFM the licensee's indicative RAV (including any Shadow RAV) balance as at 31 March in Formula Year t-2 in year-end prices.

Applicability tests

4.53. Ofgem will use two tests – gearing level test and a positive tax benefit test – to see whether there is a revised TGIE value for the licensee in respect of Formula Year t-2.

Gearing level test

4.54. Ofgem will divide the licensee's net debt figure as at 31 March in Formula Year t-2 (see paragraph 4.50(i)) into the licensee's indicative PCFM RAV (including any Shadow RAV) balance as at 31 March in Formula Year t-2 (see paragraph 4.52) to obtain an actual calculated gearing ratio.

4.55. If the actual calculated gearing ratio established under paragraph 4.54, expressed as a percentage, is lower than the notional level of gearing as set out in the Final Proposals then:

- if the existing TGIE value is zero, no revised TGIE value is determined; or
- if the existing TGIE value is not zero, it is revised to zero.

4.56. If the actual calculated gearing ratio established under paragraph 4.55, expressed as a percentage, is greater than the notional level of gearing then the positive benefit test will be performed.

Positive benefit test

4.57. Ofgem will subtract the aggregate of core and non-core modelled figures for tax deductible interest payable by the licensee in Formula Year t-2 (see paragraph 4.48) from the adjusted tax deductible interest payable reported by the licensee (see

paragraph 4.50(ii)) for Formula Year t-2. If the resultant amount is positive then the clawback has been triggered.

4.58. If the clawback has been triggered, Ofgem will multiply the result in 4.57 by the actual corporation tax rate applicable for the Formula Year to derive the licensee's benefit figure. The revised TGIE value for the licensee for Formula Year t-2 is determined as:

$$\text{Revised TGIE value} = \text{benefit figure} \times -1$$

4.59. If the benefit figure is a negative value then:

- if the existing TGIE value is zero, no revised TGIE value is determined; or
- if the existing TGIE value is not zero, it is revised to zero.

Interaction with unutilised regulatory tax losses

4.60. If for any Formula Year the licensee has a clawback but no modelled profits subject to tax then the pre-tax value of TGIE (ie the amount in 4.58) is added to the cumulative unutilised regulatory tax losses, ie it increases the losses. This will be relieved against future Core taxable profits.

Direction of revised TGIE values

4.61. Revised TGIE values will be directed in respect of Formula year t-2 and each prior Formula Year in the price control period. This is because the figures used in determining them are obtained from the licensee's annual cost reporting return which, at the time of first submission, contains data relating to Formula Year t-2 and prior years.

4.62. If, for any reason, RAV, net debt or tax deductible interest figures submitted by the licensee are subject to amendment after they have been used in determining revised TGIE values, the following procedure will be followed for the next Annual Iteration Process:

- Ofgem will re-perform the calculation of a benefit figure and the applicability tests set out above to determine whether any revised TGIE value should be determined and directed in respect of the Formula Year to which the amended figures relate. For this purpose, Ofgem will use a copy of the PCFM in its latest state to obtain a modelled figure for tax deductible interest payable by the licensee.
- If a revised TGIE value is directed for a year earlier than Formula Year t-2, any resultant changes to recalculated base revenue figures for years earlier than Formula Year t-2 calculated under an Annual Iteration Process will, subject to a time value of money adjustment, be brought forward and reflected in the calculation of the term MOD to be directed for Formula Year t. For the avoidance of doubt, such a revision will not have any retrospective effect on a previously directed value of the term MOD.

4.63. The Authority will direct any revisions to TGIE values for the licensee by 30 November in each Formula Year t-1, having given the licensee at least 14 days notice of the values which it proposes to direct.

4.64. The procedure for the Authority's direction of revised TGIE values is set out in Part D of Special Condition 3C.

Part 4 - Processing of revised TTE and TGIE values under the Annual Iteration Process

4.65. A positive incremental change in a TTE value will increase the 'recalculated base revenue figure' for the Formula Year concerned by the same amount. However, if there is any outstanding (unused) amount of regulatory tax loss for the licensee, attributable to that Formula Year or to an earlier Formula Year, the increase to the recalculated base revenue figure will be partially or fully abated by that amount, and the record of regulatory tax losses held within the PCFM will be updated accordingly.

4.66. For the avoidance of doubt, regulatory tax losses are not carried back and offset against tax liability allowances for Formula Years earlier than the Formula Year to which the regulatory tax loss concerned is attributable.

4.67. Only negative incremental changes in TGIE value are possible (resulting from a positive tax saving multiplied by minus one - see paragraph 4.58).

4.68. A negative incremental change in a TTE value or TGIE value will decrease the 'recalculated base revenue figure' for the Formula Year concerned by the equivalent amount. However, if the modelled tax liability (in the PCFM under the Annual Iteration Process) for the Formula Year concerned is smaller (in absolute terms) than the aggregate change in the TTE and TGIE value for that year, then:

- a portion of the aggregate incremental change in the TTE and TGIE values equal to the modelled tax liability will be deducted from the recalculated base revenue figure for the Formula Year concerned; and
- the remaining amount will be added to the regulatory tax loss balance for the Formula Year concerned and carried forward.

5. Corporate debt allowed percentage cost - financial adjustment methodology

Overview

5.1. The allowed revenue totals for each licensee include amounts to cover the efficient cost of raising finance for the transportation business from external sources. This is commonly referred to as the 'cost of capital'. Cost of capital allowances are calculated as a percentage return on the licensee's Regulatory Asset Value (RAV). The percentage represents Ofgem's estimate of the weighted average cost of capital (WACC)¹⁹ for the transportation business. The WACC is determined using a pre-tax cost of corporate debt percentage, a post-tax real cost of equity percentage and a weighting (notional gearing) percentage.

5.2. Under the RIIO-GD1 price control the cost of equity and notional gearing percentages are fixed for the whole of the price control period. However, the corporate debt cost percentage is updated on an annual basis with reference to a trailing average index of debt costs. The update is effected through the annual iteration of the PCFM.

5.3. The use of an indexed corporate debt percentage means that allowed revenues are appropriately updated to reflect debt market conditions. As a result, consumers will derive a benefit when debt costs fall whilst licensees and their investors are provided with assurance that higher, efficiently incurred debt costs will be funded.

5.4. The basis for updating the cost of debt index percentage value by revising PCFM Variable Values for the licensee's allowed percentage cost of corporate debt ('CDE' values) is established in Special Condition 3C (Specified financial adjustments). Special Condition 3C requires revised CDE values to be determined in accordance with the methodology in this chapter.

Temporal conventions

5.5. For the purposes of Special Condition 3C and this chapter, "Formula Year t" means the Formula Year in which a value for the term MOD, calculated through a particular Annual Iteration Process, is used in the formula for the licensee's base revenue.²⁰

¹⁹ see Glossary

²⁰ See Special Condition 1A (Restriction of revenue in respect of the Distribution Network Transportation Activity).

Methodology for determining revised PCFM Variable Values for the cost of corporate debt

5.6. At the outset of the price control period (1 April 2013), the CDE value for every Formula Year will be the pre-tax cost of debt percentage for the licensee set down in RIIO-GD1 Final Proposals.

5.7. Revised CDE values are to be derived using the pounds sterling indices of bonds issued by non-financial institutions which have a remaining maturity of 10 or more years contained in the Markit iBoxx® database of bond market data.

5.8. A revised CDE value will be determined in accordance with the methodology set out below and directed in respect of each Annual Iteration Process for Formula Year t and subsequent Formula Years. However, only the revised CDE value for Formula Year t will impact on the value of MOD for the same Formula Year t .²¹

5.9. The following steps are to be followed:

Step 1

Establish the trading days period²² to be used in relation to the particular Annual Iteration Process:

| Annual Iteration Process taking place not later than: | Trading days period |
|--|------------------------------------|
| 30 November 2013 | 1 November 2003 to 31 October 2013 |
| 30 November 2014 | 1 November 2004 to 31 October 2014 |
| 30 November 2015 | 1 November 2005 to 31 October 2015 |
| Et seq..... | Et seq..... |

²¹ Subject to revision of an earlier value – see paragraph 6.11

²² Trading days as published in the Markit iBoxx® database

Step 2

For each day in the trading day period ascertained under Step 1, calculate the average of the annual yield figures from the following two iBoxx Sterling Non-Financial Indices:

- (i). A 10+ index Markit iBoxx series reference: DE000A0JY837; and
- (ii). BBB 10+ index Markit iBoxx series reference: DE000A0JZAH1

The above indices will be sourced from the Markit data service, to which Ofgem is subscribed. The A 10+ index covers bonds rated "A+", "A", and "A-" according to Markit iBoxx's published methodology and the BBB 10+ index covers bonds rated "BBB+", "BBB", and "BBB-". Each index only produces one annual yield figure for each day. Therefore, the average for each day is calculated as:

$$\frac{\text{"A 10+ index" annual yield figure for day} + \text{"BBB 10+ index" annual yield figure for day}}{2}$$

Step 3

For each day in the trading day period ascertained under Step 1, obtain a breakeven inflation figure for 10-year government-issued bonds by applying the following formula:

$$\pi = (1 + i) / (1 + r) - 1$$

where:

- π is the Ofgem imputed breakeven inflation figure.
- i is the Yield From British Government Securities, 10 Year Nominal Zero Coupon – series reference IUDMNZC; and
- r is the Yield From British Government Securities, 10 Year Real Zero Coupon – series reference IUDMRZC.

The above series will be sourced from the statistics page on the Bank of England's website.²³ In the event that the above data series does not include an entry that

²³ <http://www.bankofengland.co.uk>

exactly matches the date from the Markit iBoxx series, the nearest older entry is to be used.

Step 4

For each day in the trading day period ascertained under Step 1, deflate the average of the annual yield figures obtained under Step 2 using the Bank of England's breakeven inflation figure obtained under Step 3, using the following formula:

$$CoD = (1 + iBoxx) / (1 + \pi) - 1$$

where:

CoD is the daily deflated average of the annual yield figures;

iBoxx is the average of the annual yield figures obtained under Step 2; and

π is the Ofgem imputed breakeven inflation figure obtained under Step 3.

This step converts the nominal bond yields in the iBoxx data to a real cost of debt value.

Step 5

Calculate the average value of *CoD* across the trading day period ascertained under Step 1.

This average, expressed as a percentage, constitutes the revised PCFM Variable Value for the cost of corporate debt which will be directed and entered into the PCFM to two decimal places.

Non-availability of iBoxx or Bank of England data

5.10. If, for any reason, iBoxx data or Bank of England data is unavailable for an entire trading days period in time to determine revised PCFM Variable Values for the cost of corporate debt for any Annual Iteration Process, then for that Annual Iteration Process only, the trading days period concerned shall be deemed to have ended on the last trading day for which data has been published. If the data concerned is subsequently published, revised PCFM Variable Values for the affected Formula Years will be directed.

5.11. If, for any reason, the iBoxx or Bank of England series identified above cease to be published, or if there is a material change in the basis of those indices, Ofgem

will consult on alternatives, as well as on any reconciliation that may need to be undertaken between the above series and any replacements.

Use of revised PCFM Variable Values in the Annual Iteration Process

5.12. The Authority will direct revised CDE values by no later than 30 November in each Formula Year t-1 in accordance with Part D of Special Condition 3C. Notice of proposed revised values will be given to the licensee at least 14 days before the date of the direction.

5.13. PCFM Variable Values for the cost of corporate debt will be directed together with all other types of PCFM Variable Value. Further information on the process is given in chapters 1 and 2.

5.14. The data and spreadsheet used to calculate revised CDE values will be published on the Ofgem website, and will be provided to the licensees with initial notification of the revised values.

6. Totex incentive mechanism – financial adjustment methodology

6.1. For RIIO-GD1 Final Proposals opening base revenues will have been modelled on the basis that actual Totex²⁴ expenditure levels are expected to equal allowed Totex expenditure levels (allowances). If actual (outturn) expenditure differs from allowances, for any Formula Year during the price control period, the Totex incentive mechanism (TIM) provides for an appropriate sharing of the incremental amount (whether an overspend or underspend) between consumers and licensees.

6.2. The PCFM contains values for both actual Totex expenditure and allowed Totex expenditure levels which, as mentioned above, are initially equal to each other. Both the actual and allowed expenditure values contained in the PCFM can be varied for the purposes of applying the TIM through the Annual Iteration Process.

Actual Totex expenditure

6.3. Actual Totex expenditure is divided into several sub-divisions to facilitate varying tax pool treatments under the Annual Iteration Process calculations. This chapter sets out the process by which the actual Totex expenditure values in the PCFM can be revised. It also describes the way in which revised figures for Totex flow into the calculation of the term MOD_t .

6.4. Special condition 3B (Determination of PCFM Variable Values for Totex Incentive Mechanism Adjustments) provide for the Authority to determine revised PCFM Variable Values for the licensee relating to actual Totex expenditure levels. They also set out the procedures for the direction of those values so that they can be used for the Annual Iteration Process.

²⁴ See Glossary

Allowed Totex expenditure

6.5. The procedures for determining and directing revised PCFM Variable Values relating to allowed Totex expenditure levels are covered in the chapters of this handbook shown in Table 6.1 below:

Table 6.1 – Special conditions with provisions to revise PCFM Variable Values relating to allowed Totex expenditure levels

| Special Condition | PCFM Variable Value | Relating to | Handbook chapter |
|-------------------|--|--|------------------|
| 3D | IRM | Innovation Roll-out allowed expenditure | 9 |
| 3E | RE | Mains and services replacement expenditure | 8 |
| 3F | IAEEPS IAESW IAECCB IAEFP IAECA IAESM IAELLC | Enhanced Physical Site Security Costs Specified street work costs Connection charging boundary change costs Fuel poor network extension scheme Central agent Smart metering roll out costs Large load connection costs | 7 |

Description of the Totex Efficiency Incentive

6.6. The Totex Incentive Mechanism (TIM) applies adjustments to the Totex figure used in the fast/slow money modelling of base revenue figures under the Annual Iteration Process. The adjustments reflect the amount of under or over expenditure by the licensee against Totex allowances and the relevant incentive strength for each licensee. The incentive strength is a percentage figure specified in special condition 3B for each licensee. It represents the percentage that a licensee bears in respect of an overspend against allowances or retains in respect of an underspend against allowances. The adjustment that is made to the Totex figures is the Funding Adjustment Rate (often called the 'sharing factor') which is calculated as $1 - \text{incentive strength}$. Applying the Funding Adjustment Rate to the over (or under spend) gives the amount that is added to (or subtracted from) the totex allowances included in base revenues.

6.7. The TIM uses the actual Totex expenditure values reported to Ofgem by 31 July each year (subject to any revisions that may be required for reporting inaccuracies or for expenditure that is not regarded as efficient) and adjusts

revenues in the following Formula Year via the MOD term. The incentive mechanism therefore operates with a two year lag.

6.8. Totex, once ascertained under the TIM, is modelled using the Totex Capitalisation rate(s), as:

- fast money – flowing directly to the base revenue figure for the Formula Year to which the allowed expenditure relates; and
- slow money - additions to the licensee's RAV in the Formula Year to which the allowed Totex expenditure relates, generating an adjustment to allowed revenues through the cost of capital return on RAV and depreciation amount.

6.9. Totex Capitalisation Rates are specified at Appendix 1 to special condition 3B and are hard coded into the PCFM as fixed input values for the licensee. GDNs have two rates of capitalisation. One for replacement expenditure (repeX) which varies by year and one that applies to other Totex and is fixed for each individual GDN over the period of the price control.

6.10. Under the Annual Iteration Process, the effects of this modelling treatment, (including any ancillary effects such as the impact on tax allowances) are reflected in the value of the term MODt.

Totex Incentive Mechanism - illustrative examples

6.11. Basic, illustrative examples of the calculation approach are set out below:

Opening position:

| | |
|--|-----|
| allowed Totex expenditure: | 100 |
| assumed actual Totex expenditure: | 100 |
| over/underspend: | nil |
| Totex amount for fast/slow money treatment | 100 |

Revised position – scenario 1:

| | |
|--|-----|
| allowed Totex expenditure: | 110 |
| actual Totex expenditure | 90 |
| underspend: | 20 |
| incentive strength say 40% (or 0.4) | |
| Totex adjustment $(1 - 0.4) \times 20$ | 12 |
| Totex amount for fast/slow money treatment $110 - 12$ | 98 |

Revised position – scenario 2:

| | |
|---|-----|
| allowed Totex expenditure: | 110 |
| actual Totex expenditure | 120 |
| overspend: | 10 |
| incentive strength say 40% (or 0.4) | |
| Totex adjustment $(1 - 0.4) \times 10$ | 6 |
| Totex amount for fast/slow money treatment $110 + 6$ | 116 |

6.12. The reduced Totex amount for fast/slow money treatment in scenario 1 represents a clawback of part of the underspend achieved by the licensee to benefit consumers. The increased Totex amount for fast/slow money treatment in scenario 2 represents a reimbursement of part of the overspend incurred by the licensee.

Application of the TIM under the Annual Iteration Process

6.13. For the purposes of Special Condition 3B and this chapter, “Formula Year t ” means the Formula Year in which a value for the term MOD calculated through a particular Annual Iteration Process, is used in the formula for the licensee’s base distribution revenue/ internal costs revenue.

6.14. The opening values for actual Totex expenditure contained in the PCFM will be revised to reflect outturn values (in 2009-10 prices) reported by the licensee in its annual cost reporting submission, subject to review by Ofgem. The normal revision cycle will be:-

| | |
|----------------------|--|
| Formula Year $t-2$: | Totex expenditure incurred |
| Formula Year $t-1$: | Outturn expenditure levels reported to Ofgem by 31 July |
| Formula Year $t-1$: | Revised PCFM Variable Values for actual Totex expenditure determined and directed by the Authority by 30 November [and, as applicable, revised PCFM Variable Values for categories of allowed Totex expenditure determined/directed – see relevant handbook chapters] |
| Formula Year $t-1$: | Value for MOD_t directed by the Authority by 30 November |
| Formula Year t : | Value for MOD_t effective in formula for licensee’s base revenue. |

The incentive mechanism therefore operates with a two year lag.

6.15. The Authority can determine and direct revised PCFM Variable Values for actual Totex expenditure for years earlier than Formula Year $t-2$ for use in any

Annual Iteration Process, but only where necessary to address a restatement of, or correction to, price control cost information submitted by the licensee.

6.16. Allowed Totex expenditure levels will be revised in accordance with the provisions of applicable scheme licence conditions and the associated methodologies in this handbook. In instances where allowed Totex expenditure levels are revised for Formula Year t-1 or later, the PCFM will automatically update expected actual Totex expenditure levels to equivalent amounts for those years. This is consistent with the modelling rationale described in the opening paragraph of this chapter.

6.17. It should be noted that:

- each Annual Iteration Process re-runs the TIM calculations for each Formula Year up to Formula Year t-2 (for later years the TIM is neutral);
- the outstanding effect of those calculations is reflected in the value of MOD_t ; and
- the PCFM works in constant 2009-10 prices, but applies adjustments to ensure that the effect of PCFM Variable Value revisions are NPV neutral with respect to Formula Year t.

Total expenditure (“Totex”)

6.18. A full definition of the expenditure items which are eligible for Totex treatment is given in the Cost and Revenue Reporting Regulatory Instructions and Guidance (RIGs) document referred to in Standard Special Condition A40 (Regulatory Instructions and Guidance) of the licence. In summary Totex consists of all the items of expenditure required for the licensee to carry on the gas distribution business with the exception of:

- costs relating to de minimis activities
- costs relating to excluded services activities
- pension deficit repair payments relating to the established deficit and for the avoidance of doubt, all unfunded early retirement deficiency costs (ERDC) post 1 April 2004
- Pension Scheme Administration and PPF levy costs
- statutory or regulatory depreciation and amortisation
- profit margins from related parties (except where permitted)
- costs relating to rebranding a company’s assets or vehicles following a name or logo change
- fines and penalties incurred by the network company (including all tax penalties, fines and interest) except if exceptionally Traffic Management Act penalty costs can be shown to be efficient
- compensation payments made in relation to standards of performance
- bad debt costs and receipts (subject to an ex post adjustment to allowed revenues)
- any asset revaluation amounts
- costs relating to the network innovation allowance

- the reversal, where appropriate, any cost reporting which is not on a normal accruals basis
- costs in relation to pass-through items, including business rates (except for business rates on non-operational buildings). Pass through items include NTS exit charges and Ofgem licence fees
- interest, other financing and tax costs (except for business rates on non-operational buildings and stamp duty land tax).

6.19. In addition, the incentive payment/deduction given/taken under the Totex Incentive Mechanism (TIM) where licensees have spent less/more than their allowance is included in Totex.

6.20. Thus the total Totex in any one year reflects the actual allowed expenditure plus the incentive adjustment. This total spend each year is split (according to the licensee's Totex Capitalisation Rate) into fast money (which is funded in the year of spend) and slow money. Slow money is added to RAV. The RAV methodology included in final proposals details any other adjustments, such as disposals proceeds, which in addition to slow money from the net additions to RAV.

6.21. It should also be noted that:

- any change in the Totex amount for the licensee under the TIM is included as an adjustment to fast / slow money.
- pension deficit repair payments relating to any incremental deficit (ie not part of the established deficit) are considered to be part of the licensee's Totex; and
- customer contributions (which mainly relate to connection works) and other proceeds received (including from legal and insurance claims) that relate to the distribution business are treated as an offset to Totex expenditure, unless specifically subject to different treatment under the Cost and Revenue reporting RIGs.

Determination of PCFM Variable Value revisions for actual Totex expenditure

6.22. Following a review by Ofgem, the Authority will, by 30 November in each Formula Year t-1, determine that the PCFM Variable Values for Formula Year t-2, shown in the first column of Table 6.2 below, should be revised to match the equivalent actual expenditure values in the licensee's annual cost reporting submission for the Totex sub-division shown in column 2 of Table 6.2.

6.23. The Authority can also determine and direct revised PCFM Variable Values for actual Totex expenditure for years earlier than Formula Year t-2 where that is necessary to address a restatement of, or correction to, price control cost information submitted by the licensee.

Table 6.2 – PCFM Variable Values for actual Totex

| PCFM Variable Value | Totex sub-division |
|----------------------------|---------------------------------------|
| ALC | Actual load related capex expenditure |
| AOC | Actual other capex expenditure |
| ACO | Actual controllable opex |
| ARE | Actual replacement expenditure |

6.24. The items of expenditure included in each of the Totex sub-divisions set out in Table 6.2 are specified in the Cost and Revenue Reporting RIGs.

Notification and direction of revised PCFM Variable Values

6.25. The PCFM exists as a constituent part of Special Condition 2A (Governance of GD1 Price Control Financial Instruments). It has an input area for each licensee containing both fixed values and variable values. The variable values are shown in the PCFM Variable Values table 6.2 above.

6.26. During each Formula Year t-1, the Authority will determine whether any PCFM Variable Values for the licensee relating to actual Totex expenditure should be revised. Part C of Special Condition 3B, requires the Authority to give the licensee at least 14 days notice of any such proposed revisions, to allow for any representations or objections. The Authority is required to have due regard to any representations or objections received from the licensee and to give reasons for its decisions in relation to them.

6.27. The Authority is required to direct any PCFM Variable Value revisions by 30 November in Formula Year t-1, so the notice of proposed values must be given no later than 16 November in the same year. In practice, the Authority will give notice of the proposed values as soon as practicably possible in Formula Year t-1.

6.28. Ofgem will then carry out the Annual Iteration Process in accordance with Special Condition 2B (see Chapter 1).

7. Uncertain costs allowed expenditure - financial adjustment methodology

Overview

7.1. Appropriate levels of allowed Totex²⁵ expenditure for some distribution business activities/requirements, will be uncertain at the time of the RIIIO-GD1 Final Proposals. For RIIIO-GD1 Final Proposals, opening base revenues will have been modelled using forecast values relating to these uncertain cost categories.

7.2. The PCFM contains values relating to allowed Totex expenditure on uncertain cost categories that can be varied for the purposes of the Annual Iteration Process. This means that the term MOD_t included in the formula for the licensee's base revenue can take account of up to date allowed expenditure levels for uncertain cost categories for the purposes of the Totex Incentive Mechanism described in chapter 6 of this handbook.

7.3. PCFM Variable Values relating to uncertain cost categories are stated in constant 2009-10 prices, consistent with the price base used in the PCFM and the values for the term MOD. The allocation of allowed expenditure for uncertain cost categories into the Totex sub-divisions referred to in table 6.2 above is handled automatically under the Annual Iteration Process using fixed attribution rates contained in the PCFM.

7.4. Special condition 3F (Arrangements for the recovery of uncertain costs) provides for the Authority to determine relevant adjustments to allowed Totex expenditure on uncertain cost categories following a proposal made either by the licensee or the Authority.

7.5. Special condition 3F also provides for the Authority to determine revised PCFM Variable Values for uncertain costs categories in accordance with the methodology set out in this chapter to give effect to adjustments which have been determined. It also sets out the procedures for the direction of revised PCFM Variable Values so that they can be used for the Annual Iteration Process.

7.6. The uncertain cost categories, and associated variable value name contained in the PCFM, are set out in Table 7.1 below, alongside the applicable licence condition.

²⁵ See Glossary

Table 7.1 – Uncertain cost categories

| Uncertain cost | PCFM Variable Value name |
|-------------------------------------|---------------------------------|
| Connection charging boundary change | IAECCB |
| Enhanced physical site security | IAEEPS |
| Large load connections | IAELLC |
| Specified street works | IAESW |
| Smart metering roll-out | IAESM |
| Agency costs | IAECA |
| Fuel poor network extension scheme | IAEFP |

Overview of uncertain cost categories

7.7. Special condition 3F specifies that any proposal for a relevant adjustment to an uncertain cost category must:

- be based on information about actual or expected costs that was not available when the licensee's opening base revenues were calculated;
- take account any prior relevant adjustments;
- relate to a material amount;
- relate to costs incurred or expected to be incurred after 1 April 2013; and
- constitute an adjustment that cannot be made under the provisions of any other Special Condition of the licence.

7.8. The stipulation that proposals must take account of any prior relevant adjustments is intended to ensure that relevant costs are not ignored on the one hand, or double counted on the other.

Connection charging boundary change

7.9. This category relates to costs incurred by the licensee in relation to any material change in the charging methodology in relation to Distributed Entry Connections.

Enhanced physical site security

7.10. This category relates to costs incurred by the licensee in complying with any requirements or formal recommendations issued by the Secretary of State for Energy and Climate Change in relation to the physical security of sites associated with the licensee's Distribution Network.

Large load connections

7.11. This category relates to costs incurred by the licensee, that cannot be recoverable through any other means, in relation to connecting new loads in order to meet its obligations under the Act.

Specified street works

7.12. This category relates to costs incurred by the licensee in complying with obligations or requirements arising under any orders or regulations made pursuant to Part 3 of the Traffic Management Act 2004 (or, in Scotland, the Transport (Scotland) Act 2005).

Smart metering roll-out

7.13. This category relates to costs incurred by the licensee, that cannot be recoverable through any other means, in facilitating the supplier led roll-out of smart meters, other than those costs

Agency costs

7.14. This category relates to the potential for a change in funding arrangements related to the central agent (ie Xoserve), and the impact that this will have on the expenditure provided to the licensee.

Fuel poor extension scheme

7.15. This category relates to a potential change to the funding provided to the licensee for complying with the fuel poor extension scheme. A change will be driven by a review of the scheme by the Authority.

Temporal conventions

7.16. For the purposes of Special Condition 3F and this chapter, "Formula Year t " means the Formula Year in which a value for the term MOD, calculated through a particular Annual Iteration Process, is used in the formula for the licensee's Base

Distribution Network Transportation Activity Revenue.²⁶ References to Formula Year t-1 etc should be construed accordingly.

7.17. A reference to, for example, *the IAEPS value for 2015-16* means the IAEPS value in the 2015-16 column of the PCFM Variable Values Table for the licensee contained in the PCFM.

7.18. Where revisions to PCFM Variable Values are directed for Formula Years earlier than Formula Year t, the effect of using those revised values in the Annual Iteration Process for the PCFM will, subject to a time value of money adjustment, be reflected in the calculation of the term MOD for Formula Year t and, for the avoidance of doubt shall not have any retrospective effect on a previously directed value of the term MOD.

7.19. Revisions to PCFM Variable Values directed for Formula Years later than Formula Year t do not feed into the calculation of the term MOD_t but (subject to further determinations) have status as values determined under the provisions of Special Condition 3F.

Determination of PCFM Variable Value revisions for uncertain cost categories

Determinations in relation to proposed adjustments

7.20. Proposals for relevant adjustments in respect of the majority of uncertain cost categories, with the exception of smart metering roll-out costs, agency costs and fuel poor network extension scheme costs, can only be made by the licensee or the Authority during application windows specified in Special Condition 3F. Proposals, in relation to all uncertain cost categories, must be made in the form of notices given by the licensee to the Authority or vice versa.

7.21. There are no application windows for proposals for relevant adjustments in respect of smart metering roll-out costs, agency costs and fuel poor network extension scheme costs. These can be made at any time. Where reference is made to application windows in the remainder of this chapter these should be ignored in respect of smart metering roll-out costs, agency costs and fuel poor network extension scheme costs.

7.22. Following the end of each application window (or in relation to smart metering roll-out costs after the receipt of a proposal for an adjustment) the Authority has four months to confirm, reject or vary the proposed adjustment in a determination decision. In reaching that decision the Authority must:

- consult with the licensee concerned and other interested parties;

²⁶ See Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity).

- have particular regard to the purposes of the licence condition; and
- take no account of the general financial performance of the licensee under the price control arrangements.

7.23. If the Authority does not make a determination decision in relation to a duly submitted adjustment proposal within the four month period referred to in paragraph 7.22, then the adjustment is deemed to have been made.

7.24. In relation to agency costs and fuel poor network extension scheme costs, the Authority can commence a review at any time.

Determination of PCFM Variable Values

7.25. It follows from the timetable outlined in paragraphs 7.20 to 7.24 above that the Authority will only determine revised PCFM Variable Values relating to uncertain cost categories (as set out in Table 7.1) for use in the Annual Iteration Process following the year in which an application window arises or, in relation to smart metering roll-out costs following the receipt of a proposed adjustment and the conclusion of the assessment process. In relation to agency costs and fuel poor network extension scheme costs the Authority will determine revised PCFM Variable Values after the conclusion of the reviews.

7.26. It should be noted that the determination can amend PCFM Variable Values for any years in the RIIO-GD1 period.

7.27. The following procedures will be carried out by the responsible Ofgem team to facilitate the determination of any revised PCFM Variable Values relating to uncertain cost categories for the Annual Iteration Process:

- following receipt of a notice proposing an adjustment, liaison will be maintained with the Ofgem team responsible for the review of proposed adjustments and any determination made by the Authority will be noted;
- prior to the start of the annual iteration process, the aggregate net adjustment (whether upward or downward) for the licensee in respect of each uncertain costs category will be ascertained by totalling the amounts of:
 - any determinations of relevant adjustments made by the Authority;
 - any adjustments duly proposed by the licensee, and not withdrawn, which have not been determined by the Authority;

and

each aggregate net adjustment will be rebased to the 2009-10 price base used in the PCFM in accordance with paragraph 1.7 of chapter 1 of this handbook.

7.28. Each aggregate net adjustment ascertained under paragraph 7.27 will be applied to the equivalent pre-existing PCFM Variable Value contained in the PCFM for the licensee and the resulting figure will be determined by the Authority to be the revised PCFM Variable Value for that uncertain costs category.

7.29. For the avoidance of doubt, under the procedures outlined in paragraphs 7.27 and 7.28, the Authority can determine a revision to the PCFM Variable Value relating to an uncertain cost category for any Formula Year during the price control period, where that is necessary to reflect the determination (or deeming) of a relevant adjustment in respect of that uncertain cost category.

Notification and direction of revised PCFM Variable Values

7.30. Special Condition 3F provides for the licensee to be notified of any relevant adjustment determinations within 14 days of the making of the determination. However, consistent with the provisions of other Special Conditions providing for the determination of PCFM Variable Values, there is an additional formal procedure for the notification and direction of revised PCFM Variable Values, set out in Part E of Special Condition 3F.

7.31. The Authority will give notice of the PCFM Variable Value revisions that it proposes to direct by 16 November, being at least 14 days before the deadline date for the direction of revised PCFM Variable Values which is 30 November. The notice will confirm that:

- any revised PCFM Variable Value determinations have been made in accordance with Special Condition 3F, which cross refers to this chapter of the GD1 Price Control Financial Handbook; and
- the licensee has 14 days from the date of the notice in which to make any representations concerning the proposed PCFM Variable Value revisions.

7.32. The Authority is required to have due regard to any representations or objections made by the licensee and to give its reasons for any decisions in relation to them.

7.33. As set out in paragraph 7.25, the Authority will not determine PCFM Variable Value revisions for uncertain cost categories by November in years in which no proposal has been duly made by the licensee or the Authority. However, the overall direction issued in those years will include a facsimile of the PCFM Variable Values Table(s) for the licensee showing the post direction state of all PCFM Variable Values. This will serve to confirm the state of the PCFM Variable Values relating to uncertain cost categories.

Delay in direction of revised PCFM Variable Values

7.34. If the procedures set out in Special Condition 3F and in Parts 2 and 3 of this chapter call for the Authority to direct revised PCFM Variable Values for uncertain cost categories by 30 November and if the Authority does not make such a direction, then Special Condition 3F requires that the values should be directed by the Authority as soon as is practicable to facilitate the notification and direction of the value of the term MOD_t under Special Condition 4B (Annual Iteration Process for the PCFM).

8. Mains and services replacement allowed expenditure - financial adjustment methodology

Mains and Services Replacement – allowed expenditure

8.1. During the price control period ('RIIO-GD1') each licensee is required to carry out mains replacement, services replacement and services transfer activity relating to mains and services which are categorised as being Above Threshold Tier 2 ('ATT2'). We refer to this activity as 'Repex T2'.

8.2. The opening base revenue allowances ('PU' values) for each licensee, set down in the table at Appendix 1 to Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity) reflect allowed expenditure figures for forecast levels of ATT2 mains replacement.

8.3. The allowed expenditure figures referred to in paragraph 8.2 constitute the 'RE' values contained in the Variable Values Table of the PCFM as at 1 April 2013, the first day of RIIO-GD1.

8.4. It is necessary to revise RE values during the course of RIIO-GD1 so that they represent allowed expenditure levels driven by actual (outturn) levels of Repex T2 reported by each licensee. This ensures that the value of the term MOD_t which is calculated through the Annual Iteration Process for the PCFM appropriately reflects updated allowed expenditure on Repex T2 as a component of Totex in:-

- (i) fast and slow money allowed revenue calculations and
- (ii) allowed revenue adjustments under the Totex Incentive Mechanism (see chapter 6).

8.5. The provisions for determining revised RE values are contained in Special Condition 3E (Mains and Services Replacement Expenditure). All RE values are stated in 2009/10 prices.

Temporal convention

8.6. For the purposes of Special Condition 3E and this chapter, "Formula Year t " means the Formula Year in which a value for the term MOD_t , calculated through a particular Annual Iteration Process, is used in the formula for the licensee's Base Distribution Revenue.²⁷ References to Formula Year $t-1$ etc should be construed accordingly.

²⁷ See Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity).

Determination and direction of revised RE values

8.7. Part B of Special Condition 3E (Mains and Services Replacement Expenditure) contains a formula which specifies what the RE value is to be for each Formula Year t-2.

8.8. The first Formula Year of RIIO-GD1 is 2013-14 which ends on 31 March 2014. Each licensee will report the Repex T2 activity values specified in Part B of Special Condition 3E for that year by no later than 31 July 2014.

8.9. Ofgem will determine revised RE values for Formula Year 2013/14 between 31 July 2014 and 30 November 2014 - the deadline for directing revised RE values to be used in the Annual Iteration Process which will take place by 30 November 2014 (see Chapter 2).

8.10. This process will be repeated annually:-

- (i) Formula Year t-2 – activity and expenditure occurs
- (ii) by 31 July in Formula Year t-1 – licensee reports activity and actual expenditure levels to Ofgem
- (iii) by 30 November in Formula Year t-1 – Authority directs a revised RE value for Formula Year t-2 (and any earlier years in accordance with paragraph 9 of Special Condition 3E)
- (iv) by 30 November in Formula Year t-1 – Authority carries out Annual Iteration Process and directs value of MODt for Formula Year t.

8.11. The Authority's direction of revised RE value by no later than 30 November in each Formula Year t-1 will be made in accordance with Part C of Special Condition 3E.

Processing of RE values under the Annual Iteration Process

8.12. Under the Annual Iteration Process, RE values, as revised, representing allowed Repex T2 expenditure are allocated to:-

- fast and slow money²⁸ totals in accordance with the Totex Capitalisation Rate (per cent) specified in the RIIO-GD1 Final Proposals and
- the 'repex' category of totex for the purposes of subsequent allocation to tax pools within the PCFM.

²⁸ See Glossary

8.13. RE values, as revised, for all Formula Years up to and including Formula Year t are then used with other PCFM variable values under the Annual Iteration Process -

- (i). in calculating the value of the term MOD_t for Formula Year t including:
 - fast money components,
 - amounts of return and depreciation on the licensee's RAV balance,
 - tax allowance effects,
 - Totex Incentive Mechanism adjustments, and
- (ii). to update Totex related balances held within the PCFM including the licensee's RAV balance.

8.14. Under the Annual Iteration Process described in chapter 2 the effect of revised RE values directed for Formula Years earlier than Formula Year $t-2$ (see paragraph 8.9(iii)) flows through to the determination of the value of MOD_t and will have no retrospective effect on previously directed values of MOD .

8.15. RE values held in the PCFM for Formula Years later than year t in relation to a particular Annual Iteration Process do not feed into the calculation of the term MO_{Dt} and remain at the forecast levels referred to in paragraphs 8.2 and 8.3 pending any subsequent revision. Accordingly, all calculated values in the PCFM for Formula Years later than Formula Year t have indicative status only.

9. Innovation role-out mechanism allowed expenditure – financial adjustment methodology

Innovation roll-out mechanism

Overview

9.1. The purpose of this chapter of the price control financial handbook is to set out the methodology to determine the values relating to Innovation Roll-out allowed expenditure ('IRM' values) and the regulatory years to which those revisions relate.

9.2. The provisions for determining revised IRM values are contained in Special Condition 3D (The Innovation Roll-out Mechanism). All IRM values are stated in 2009-10 prices.

9.3. The application of the methodologies set out in this chapter of the handbook will mean that as a consequence of the Annual Iteration Process, the value of the term MOD as calculated for Formula Year t will result in an appropriate adjustment of the base revenue of the licensee so that it is the same as it would have been had the forecast values used in the model been the same as the actual outturn values.

9.4. The opening base revenue allowances ('PU' values) for each licensee, set down in the table at Appendix 1 to Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity) reflect allowed expenditure figures for forecast levels of innovation expenditure (and will be zero at the outset).

9.5. The allowed expenditure figures constitute the 'IRM' values contained in the Variable Values Table of the PCFM as at 1 April 2013, the first day of RIIO-GD1.

9.6. It may be necessary to revise IRM values during the course of RIIO-GD1 so that they represent allowed expenditure levels driven by additional innovation funding. This ensures that the value of the term MOD_t which is calculated through the Annual Iteration Process for the PCFM appropriately reflects updated allowed expenditure on innovation as a component of Totex in -

- (i) fast and slow money allowed revenue calculations and
- (ii) allowed revenue adjustments under the Totex Incentive Mechanism (see chapter 6)

Temporal convention

9.7. For the purposes of Special Condition 3D and this chapter, "Formula Year t " means the Formula Year in which a value for the term MOD, calculated through a

particular Annual Iteration Process, is used in the formula for the licensee's Base Distribution Revenue.²⁹ References to Formula Year t-1 etc should be construed accordingly.

Determination and direction of revised IRM values

9.8. Part A of Special Condition 3D (The Innovation Roll-out Mechanism) specifies the Features that qualify a roll-out for additional funding.

9.9. Part B of Special Condition 3D (The Innovation Roll-out Mechanism) specifies the licensees' ability to propose a relevant adjustment to the IRM value.

9.10. Part C of Special Condition 3D (The Innovation Roll-out Mechanism) specifies two periods when these adjustments can be proposed -

- (a) the first application window opens on 1 May 2015 and closes on 31 May 2015 and
- (b) the second application window opens on 1 May 2018 and closes on 31 May 2018

9.11. For the first application window Ofgem will determine revised IRM values for Formula Year 2016-17 (if necessary) between 31 July 2015 and 30 November 2015 - the deadline for directing revised IRM values to be used in the Annual Iteration Process which will take place by 30 November 2015 (see Chapter 2)

9.12. For the second application window Ofgem will determine revised IRM values for Formula Year 2019-20 (if necessary) between 31 July 2018 and 30 November 2018 - the deadline for directing revised IRM values to be used in the Annual Iteration Process which will take place by 30 November 2018 (see Chapter 2).

9.13. The Authority's direction of revised IRM value by no later than 30 November in each Formula Year t-1 will be made in accordance with Part D of Special Condition 3D.

Processing of IRM values under the Annual Iteration Process

9.14. Under the Annual Iteration Process, IRM values, as revised, representing allowed innovation expenditure are allocated to-

- fast and slow money totals in accordance with the Totex Capitalisation Rate (per cent) specified in the RIIO-GD1 Final Proposals and
- the tax pools associated with innovation expenditure in accordance with the licensee specific tax allocation profile, within the PCFM

²⁹ See Special Condition 1B (Restriction of revenue in respect of the Distribution Network Transportation Activity).

9.15. IRM values, as revised, for all Formula Years up to and including Formula Year t are then used with other PCFM variable values under the Annual Iteration Process:

- (i) in calculating the value of the term MOD_t for Formula Year t including -
 - a. fast money components
 - b. amounts of return and depreciation on the licensee's RAV balance
 - c. tax allowance effects
 - d. Totex Incentive Mechanism adjustments and
- (ii) to update Totex related balances held within the PCFM including the licensee's RAV balance.

9.16. Under the Annual Iteration Process described in Chapter 2 the effect of revised IRM values directed for Formula Years earlier than Formula Year t-2 flow through to the determination of the value of MOD_t and will have no retrospective effect on previously directed values of MOD. This point is confirmed in paragraph 14 of Special Condition 3D.

9.17. IRM values held in the PCFM for Formula Years later than year t in relation to a particular Annual Iteration Process do not feed into the calculation of the term MOD_t and remain at the forecast levels referred to in paragraph 12.4 pending any subsequent revision. Accordingly, all calculated values in the PCFM for Formula Years later than Formula Year t have indicative status only.

10. Legacy price control adjustments – financial methodologies

Introduction

10.1. The purpose of this chapter of the GD1 Price Control Financial Handbook is to set out the methodologies that are to be used to determine values for each component term ('component term values') in the formulae set out in Part A of Special condition 3A (Legacy price control adjustments). The formulae and components are set out below. The methodologies are set out in Parts 1 to 6 below.

$$\text{LAR} = \text{PAR} + \text{TAR} + \text{FAR} + \text{CAR} + \text{SAR}$$

$$\text{LRAV} = \text{FRAV} + \text{CRAV} + \text{MRAV} + \text{SRAV}$$

Overview

10.2. The formulae referred to in paragraph 10.1 are used to determine revised values for PCFM Variable Values, that relate to-

- (a) legacy price control revenue allowance adjustments (LAR values) and
- (b) legacy price control adjustments to RAV additions (LRAV values)

for Formula Year 2013-14. In overview, LAR and LRAV are incremental adjustments between amounts calculated at final proposals (on which opening base revenues were set) which may have used forecast or estimated amounts and updated calculations to factor in additional information.

10.3. Legacy price control adjustments are necessary, to take account of outturn levels of

- (a) activities carried out by the licensee
- (b) incentivised performance by the licensee and/or
- (c) expenditure incurred by the licensee

in specified legacy price control adjustment categories during Formula Years prior to 1 April 2013 (the 'legacy period'). These 'legacy outturn levels' will either not have been available, or will not have been confirmed, when the licensee's opening base revenues were set.

10.4. The PCFM Variable Values LAR and LRAV represent the net incremental changes (which may be positive or negative) to revenue allowance and RAV addition amounts to reflect legacy outturn levels. It should be noted, however, that revisions to LAR and LRAV values will also have ancillary effects on other calculations under the Annual Iteration Process which feed into recalculated base revenue figures.

10.5. Each component term value (see Table 10.1) in the formulae for LAR and LRAV represents the incremental change for a particular legacy price control adjustment category. At the outset of the price control period on 1 April 2013, all LAR and LRAV values will be zero, because provisional or forecast legacy outturn levels will have been used in modelling the licensee's opening base revenue allowances.

10.6. The use of revised LAR and LRAV values for Formula Year 2013-14 in the Annual Iteration Process for the PCFM will mean that values of the term MOD_t will appropriately reflect legacy outturn levels.

10.7. The aggregate revenue allowance adjustment embodied in the LAR term will be spread evenly across base revenue calculations for the eight years of the price control period. However, there are no provisions to revise LAR or LRAV values for Formula Years other than Formula Year 2013-14 - all necessary calculations and effects are achieved under the Annual Iteration Process, with appropriate time value of money adjustments.

10.8. For the avoidance of doubt, legacy price control adjustments are not subject to the Totex Incentive Mechanism.

10.9. A determination of component term values will be carried out during each Formula Year of the price control period, in time to determine any necessary revisions to LAR or LRAV values for each Annual Iteration Process.

10.10. Legacy outturn values for each legacy price control adjustment category will be applied to a determination of component term values as soon as they become available in accordance with the methodologies set out in parts 1 to 5 of this chapter.

10.11. It might be necessary for a legacy outturn value to be restated by the licensee or adjusted by Ofgem after it has been applied to the determination of a component term value because of

- errors or omissions in the preparation of information or inconsistencies with relevant regulatory instructions and guidance (RIGs) or
- an efficiency review by Ofgem, referred to in one of the methodologies in parts 1 to 5 of this chapter.

In either of those circumstances, the restated/adjusted legacy outturn value would be applied in place of the original value in a subsequent determination of component term values, and reflected in a revision to the relevant PCFM Variable Value for the next Annual Iteration Process.

Legacy price control adjustment categories

10.12. Each component term in the formulae set out in Part A of Special condition 3A relates to one of the categories shown in Table 10.1 below.

Table 10.1 – Legacy price control adjustment categories

| Category | Special Condition | Applicable licensees | Component Term | Component in PCFM Variable Value | See Part of this chapter |
|--|--------------------------|-----------------------------|-----------------------|---|---------------------------------|
| Pension adjustments | 3A | All | PAR | LAR | 1 |
| Gearing and interest cost adjustments | 3A | All | TAR | LAR | 2 |
| Non Gas Fuel Poor Network Extension Scheme adjustments | 3A | All | FAR FRAV | LAR LRAV | 3 |
| Capex incentive scheme adjustments | 3A | All | CAR CRAV | LAR LRAV | 4 |
| Mains and services replacement expenditure adjustments | 3A | All | MRAV | LRAV | 5 |
| Security Logged up costs | 3A | All | SAR SRAV | LAR LRAV | 6 |

Conventions

10.13. All component term values will be stated and PCFM Variable Values directed in 2009-10 prices, consistent with the price base used in the PCFM and with directed values for the term MOD.

10.14. In the remainder of this chapter "Formula Year t" means the Formula Year in which a value for the term MOD, calculated through a particular Annual Iteration Process, is used in the formula for the licensee's Base Distribution Network Transportation Activity Revenue and references to Formula Year t-1 etc should be construed accordingly.

Reference documents

10.15. The reference documents (previously published by Ofgem) referred to in this chapter are:

1. GDPCR Final Proposals (Ref 285/07)
<http://www.ofgem.gov.uk/Pages/MoreInformation.aspx?docid=362&refer=Networks/GasDistr/GDPCR7-13>
2. Decision on strategy for the next transmission and gas distribution price controls - RIIO-T1 and GD1 Financial issues

Legacy adjustment calculation workbooks

10.16. As noted in paragraph 10.5, the modelling of the licensee's opening base revenues will have included revenue allowances and RAV addition values for legacy price control adjustments derived from provisional or forecast legacy outturn levels. Those revenue allowance and RAV addition values, represented by fixed input values

in the PCFM, will have been established in accordance with applicable licence scheme provisions and, by dint of the PCFM's incorporation into Special Condition 2A (Governance of GD1 Price Control Financial Instruments), the basis for setting those fixed values will have been consulted upon and accepted by the licensee.

10.17. As part of its Final Proposals for the RII0-GD1 price control (see associated document 'b'), the Authority will provide to the licensee a legacy adjustment calculation workbook ('calculation workbook') in Excel® format. The calculation workbook will contain a worksheet relating to each legacy price control adjustment category and have functionality to calculate and display component term values. Upon issue, blue shaded cells on each worksheet will show the provisional or forecast legacy outturn levels referred to in paragraph 10.5.

10.18. Calculation workbooks will be designed to perform the calculation of component term values using legacy outturn values, in a way which is consistent with:

- the regimes and licence scheme provisions applicable to each legacy price control adjustment category;
- the calculation and determination of the revenue allowance and RAV addition values for legacy price control adjustments included in the licensee's opening base revenues (see paragraph 10.5);
- references to the use of the calculation workbook in the methodologies set out in Parts 1 to 5 of this chapter.

10.19. For the avoidance of doubt, in the event of any conflict between the licence (including this handbook) and the content or functionality of a calculation workbook, the stipulation or meaning given in the licence shall prevail.

Part 1 - Determination of component value for legacy pension adjustment

10.20. This part set outs the methodology for determining the value of the component term PAR, the revenue allowance adjustment relating to pension scheme allowance and payment levels in the legacy period. Legacy pension adjustments do not affect RAV balance additions.

Description of the adjustment

10.21. In its decision on strategy for the RIIIO-GD1 price control (see reference document 1), the Authority confirmed the approach that would be used to make a financial adjustment (whether upwards or downwards) for

- (a) the difference between the licensee's allowance for pension deficit repair payments (including any one-off pension deficit repair contributions) and the actual pension deficit repair payments made by the licensee and
- (b) the difference between the licensee's allowance for ongoing pension scheme funding costs³⁰ and the actual ongoing funding payments made by the licensee

for each Formula Year in the GDPCR price control period (which ran from 1 April 2007 to 31 March 2013).

10.22. The aggregated difference amount, subject to an amendment for tax effects, is applied as an adjustment, colloquially referred to as a pension 'true-up'.

10.23. The licensee's allowances for pension deficit repair payments were set at the outset of the GDPCR price control. However, allowances for ongoing pension scheme funding costs are determined by the formula:

total of pensionable salary payments x allowed contribution rate,

meaning that the allowance level is not finalised until pensionable salary payments have been reported by the licensee, after the end of the Formula Year concerned.

Amendment for tax effects

10.24. If the level of actual payments made by the licensee is higher than the allowances provided, the licensee will have enjoyed higher tax deductions than was anticipated, meaning that its price control tax allowance for the Formula Year concerned will have been higher than, in retrospect, was warranted. In that scenario, the aggregated difference amounts are subject to a deduction equating to:

³⁰ Including scheme costs in respect of scheme administration and PPF levy costs where applicable under RIGs.

the aggregated difference amount X the main rate of corporation tax ³¹
for the Formula Year concerned

10.25. However, if the licensee was unable to obtain a benefit from the extra tax deduction during the Formula Year concerned, then the amount calculated under the formula in paragraph 10.24 is instead added to the licensee's regulatory tax loss balance to be carried forward.³²

10.26. No amendments or changes to regulatory tax loss balances are made if the level of actual payments made by the licensee are lower than the allowances provided.

Formula years in the legacy period subject to adjustment

10.27. Finalised allowance and actual payment levels relating to Formula Years up to and including 2011-12 will have been available in time to factor revenue allowance adjustments into the licensee's opening base revenues, with the revenue allowance amounts being spread across the eight years of the price control period (see Chapter 6 of reference document 1).

10.28. The following items relating to Formula Year 2012-13 will not have been available when the licensee's opening base revenues were set and forecast legacy outturn levels will have been used in setting the licensee's opening base revenues

- the licensee's allowance for ongoing pension scheme funding costs
- the licensee's actual ongoing pension scheme funding payments and
- the licensee's actual pension deficit repair payments (including any one-off pension deficit repair contributions)

10.29. A legacy price control pension adjustment therefore needs to be made to reflect the legacy outturn levels for the items referred to in paragraph 10.28.

10.30. The level of actual pension payments made by the licensee in Formula Year 2012-13 is expected to be included in the price control review information submission which it will make by 31 July 2013. In confirming the level of actual payments made, the Authority will satisfy itself that payments reported by the licensee were made in accordance with the pension principles set out in annex 7 to reference document 1 and summarised at paragraph 3.5 of this handbook.

³¹ The official main rate of Corporation Tax and not the modelled tax rate – see also paragraph 10.37.

³² A positive regulatory tax loss balance represents one or more price control tax benefits which have been obtained by the licensee and which may be subject to off-set against future regulatory tax allowances. Regulatory tax losses should therefore not be confused with trading or group tax losses.

Relationship with pension adjustments for the RIIO-GD1 price control period

10.31. As explained in paragraph 14 in Chapter 3 of this handbook, pension adjustments relating to the legacy period are separate from pension allowance financial adjustments made under the provisions of Special Condition 3C (Specified financial adjustments).

Determination of the value of the component term PAR

10.32. The steps set out in paragraphs 10.33 to 10.37 below will be followed to determine the value of the component term PAR.

Step 1

10.33. After 31 July 2013, Ofgem will obtain from price control review information submissions relating to Formula Year 2012-13 the licensee's

- actual pension deficit repair payments (including any one-off pension deficit repair contributions) for Formula Year 2012-13
- actual total of pensionable salary payments for Formula Year 2012-13
- actual ongoing pension scheme funding for Formula Year 2012-13
- actual Corporation Tax paid figure

in each case for Formula Year 2012-13.

Step 2

10.34. Ofgem will deflate the amounts referred to in Step 1 from the 2012-13 price base used in the relevant price control review information submissions to the 2009-10 price base used in the PCFM using actual RPI data (see section on price base in Chapter 1).

Step 3: Use of the legacy adjustment calculation workbook

10.35. The deflated legacy outturn values obtained under steps 1 and 2 will be used to overwrite the forecast legacy outturn values for Formula Year 2012-13 on the PAR worksheet of the calculation workbook.

10.36. Using the deflated legacy outturn values, the calculation workbook is designed to:

- (a) calculate the actual ongoing pension scheme funding allowance for Formula Year 2012-13 and the true-up amount which should have applied
- (b) calculate the pension deficit repair true-up amount which should have applied for Formula Year 2013-14

- (c) apply time value of money adjustments to the amounts calculated under sub-paragraphs (a) and (b) for the year from 2012-13 to 2013-14
- (d) apply the tax adjustment referred to in paragraph 10.24 if the licensee paid corporation tax in Formula Year 2012-13
- (e) calculate the total true-up amount which should have applied for Formula Year 2013-14
- (f) deduct the true-up amount already included in the modelling of the licensee's opening base revenues to give the incremental adjustment
- (g) show the result as the value for the component term PAR.

10.37. The value referred to in paragraph 10.36(g) will be determined to be the value of the component term PAR.

10.38. It should be noted that, if the licensee did not pay corporation tax in Formula Year 2012-13, the licensee's regulatory tax loss balance will not be updated in this respect. The licensee's regulatory tax loss balance is held in the PCFM.

Restatement or adjustment of values used in the determination of PAR

10.39. As set out in paragraph 9 of this chapter, a determination of each component term value will be carried out during each Formula Year of the price control period. If, exceptionally, it is necessary for one or more of the values used in steps 1 to 4 above to be restated or adjusted after its use in a determination of the component term PAR, the value of PAR would be re-determined using the restated/adjusted values for the purpose of determining a revision to the PCFM Variable Value LAR, for use in the next available Annual Iteration Process.

Part 2 - Determination of component value for legacy gearing level and interest cost adjustment

10.40. This part set outs the methodology for determining the value of the component term TAR, the revenue allowance adjustment relating to the licensee's gearing levels and corporate debt interest costs in the legacy period. Legacy gearing and interest cost adjustments do not affect RAV balance additions.

Description of the adjustment

10.41. In its open letter dated 31 July 2009 (see reference document 3), the Authority confirmed the approach that would be used to 'clawback' any tax value benefits to the licensee of operating at a level of gearing higher than modelled levels. The methodological approach set out in the letter has been applied in:

- (a) determining the gearing level and interest cost adjustments to be included in the licensee's opening base revenues and
- (b) setting out the methodology for the legacy gearing level and interest cost adjustment in this part.

Save for some procedural details, it is also consistent with the methodology for (RIIO-GD1 period) adjustments driven by gearing levels and corporate debt interest costs set out in part 3 of chapter 4 of this handbook.

10.42. The outturn values needed to calculate legacy gearing level and interest cost adjustments in respect of a particular Formula Year are the licensee's

- net debt as at 31 March in the Formula Year
- RAV balance as at 31 March in the Formula Year and
- actual corporate debt interest payments

in each case, derived in accordance with the criteria set out in reference document 3 from information submissions made by the licensee in accordance with applicable RIGs.

10.43. The RAV balance referred to in this chapter includes both core and non-core (or shadow) RAV.

Formula years in the legacy period subject to adjustment

10.44. Finalised net debt, RAV balance and corporate debt interest levels relating to Formula Years up to and including 2011-12 will have been available in time to factor revenue allowance adjustments into the licensee's opening base revenues, with the revenue allowance amounts being spread across the eight years of the price control period.

10.45. Finalised net debt, RAV balance and corporate debt interest levels relating to Formula Year 2012-13 will not have been available when the licensee's opening base

revenues were set and forecast legacy outturn levels for those items for that year will have been used in setting the licensee's opening base revenues. A legacy price control gearing level and interest cost adjustment therefore needs to be made to reflect legacy outturn levels for net debt, RAV balance and corporate debt interest costs for Formula Year 2012-13.

10.46. Finalised net debt, RAV balance and corporate debt interest levels relating to Formula Year 2012-13 are expected to be included in the price control review information submission that the licensee will make by 31 July 2013.

Determination of the value of the component term TAR

10.47. The steps set out in paragraphs 10.48 to 10.52 below will be followed to determine the value of the component term TAR.

Step 1

10.48. After 31 July 2013, Ofgem will obtain from price control review information submissions relating to Formula Year 2012-13 the licensee's

- net debt balance as at 31 March in Formula Year 2012-13
- RAV balance as at 31 March in Formula Year 2012-13 and
- actual corporate debt interest payments in Formula Year 2012-13.

Step 2 Use of the legacy adjustment calculation workbook

10.49. The legacy outturn values, in nominal terms, obtained under step 1 will be used to overwrite the forecast legacy outturn values for Formula Year 2012-13 on the TAR worksheet of the calculation workbook.

10.50. Using the deflated legacy outturn values, the calculation workbook is designed to:

- (c) perform a gearing level test - if actual gearing (net debt/RAV balance) is lower than the nominal gearing levels specified in the GDPCR Price Control Final Proposals (see reference document 1), then the gearing level and interest cost adjustment for 2012-13 will be zero and
- (d) perform a positive benefit test - if actual corporate debt interest payments in 2012-13 are lower than the level used in the modelling of the licensee's base revenue for Formula Year 2012-13, then the gearing level and interest cost adjustment for 2012-13 will be zero.

10.51. If both of the circumstances in sub-paragraphs 10.50 (a) or (b) applies, the functionality in the calculation workbook will multiply the forecast legacy gearing level and interest cost adjustment used in setting the licensee's opening base

revenues (expressed as a negative figure) by -1 to give the incremental adjustment amount which will be shown as the value for the component term TAR.

Restatement or adjustment of values used in the determination of TAR

10.52. As set out in paragraph 9 of this chapter, a determination of each component term value will be carried out during each Formula Year of the price control period. If, exceptionally, it is necessary for one or more of the values referred to in step 1 above to be restated or adjusted after its use in a determination of the component term TAR, the value of TAR would be re-determined using the restated/adjusted values for the purpose of determining a revision to the PCFM Variable Value LAR, for use in the next available Annual Iteration Process.

Part 3 - Determination of component value for legacy non-gas fuel poor network extension scheme adjustment

10.53. This part set outs the methodology for determining the value of the following component terms

- FAR - the revenue allowance adjustment and
- FRAV – the RAV additions adjustment

relating to non-gas fuel poor network extension activity in the legacy period.

Description of the FAR and FRAV adjustment

10.54. During the GDPCR price control period the licensee was incentivised to provide discounted gas connections to deprived households meeting eligibility criteria under the non-gas fuel poor network extension scheme. The incentive and discount arrangements are described in the Authority's open letter dated 29 June 2011 (see reference document 4).

10.55. The non-gas fuel poor network extension scheme was instigated after the commencement of the GDPCR price control period therefore projected capex amounts were not included in projected RAV balance or revenue allowance calculations. Therefore, capital expenditure by the licensee was recorded ('logged up') for addition to the licensee's RAV balance at the start of the next price control period.

10.56. The PCFM already includes the fuel poor RAV workings which includes the logged up capex together with the incentive adjustment for each of the scheme years during GDPCR1 so as to calculate the amount to be added to the licensee's RAV balances for the commencement of RIIO-GD1. These workings include an estimate of values for 2012-13.

10.57. Under the incentive arrangement, a net present value amount, for community based schemes, was deemed to be added to the licensee's RAV (as at the scheme inception date) for each eligible household connecting during each year of the five year scheme period. These amounts were deemed to remain in the licensee's RAV balance for five years. The incentive adjustment has been written off equally over the five years it is included in RAV.

10.58. The legacy calculation workbook includes a duplicate copy of the fuel poor workings that are contained within the PCFM so as to calculate the adjustment to be included in base revenue for final proposals based on unearned return and depreciation whilst these costs were being logged up.

10.59. The fuel poor RAV calculations assume that depreciation is on a sum of digits basis for the purposes of the logged up calculations.

10.60. The FAR and FRAV terms are the calculation of incremental amounts compared to those already included in price control base revenues. They arise where the estimates of values used in deriving the amounts included in the base revenues are updated with actual values during subsequent annual iteration processes.

10.61. The FRAV adjustment is a component part of the LRAV term and is therefore not separate from the LRAV. In the PCFM it is therefore treated as an adjustment to the main RAV balance rather than the specific fuel poor RAV workings.

The non-gas fuel poor network extension scheme in the RIIO-GD1 period

10.62. The non-gas fuel poor network extension scheme has an ex-ante allowance set for the RIIO-GD1 period. There is an uncertainty mechanism related to the scheme which is detailed in Chapter 7 above.

Determination of the value of the component term FAR and FRAV

10.63. The legacy calculation workbook performs calculations to derive the FAR and FRAV amounts in line with the steps set out below.

Step 1

10.64. After 31 July 2013, Ofgem will obtain from price control review information submissions which will include the actual amount of capex expenditure and the relevant incentive adjustments by the licensee on non-gas fuel poor network extension schemes in Formula Year 2012-13.

Step 2

10.65. Ofgem will deflate the amount referred to in Step 1 from the 2012-13 price base used in the relevant price control review information submissions to the 2009-10 price base used in the PCFM using RPI data contained in the legacy workbook.

Step 3 Use of the legacy adjustment calculation workbook

10.66. The actual capex value and incentive adjustments, in 2009-10 prices, will be used to overwrite the forecast value for Formula Year 2012-13 on the FRAV worksheet of the calculation workbook.

10.67. The functionality of the legacy calculation workbook will deduct any capex value for 2012-13 already included in the opening RAV balance for Formula Year 2013-14 in the PCFM to give the incremental adjustment amount which will be shown as the value for the component term FRAV.

10.68. The functionality of the legacy calculation workbook will also calculate the FAR term from the values already input to calculate the FRAV adjustment.

Restatement or adjustment of values used in the determination of FAR and FRAV

10.69. As set out in paragraph 9 of this chapter, a determination of each component term value will be carried out during each Formula Year of the price control period. If it is necessary for one or more of the values above to be restated or adjusted after use in a determination of the component term FAR or FRAV, the value of FAR or FRAV concerned would be re-determined using the restated/adjusted values for the purpose of determining a revision to the PCFM Variable Value LAR or LRAV, for use in the next available Annual Iteration Process.

Part 4 - Determination of component value for the legacy capex incentive scheme adjustment

10.70. This part sets out the methodology for determining the value of the component terms CAR and CRAV, the revenue allowance and RAV balance addition adjustments relating to the licensee's actual expenditure levels on capital expenditure (capex) and non-incentivised replacement expenditure (repex) activities during the GDPCR price control period.

Description of the adjustment

10.71. The relevant capex and repex allowances that were set at the outset of the GDPCR price control period gave rise to RAV balance additions and revenue allowance amounts based upon assumed levels of expenditure.

10.72. The GDPCR capex incentive scheme provided for the licensee to retain/bear an appropriate share of any under/over spend against the projected allowances, with the effects being logged up for adjustment in the price control modelling for the RIIO-GD1 price control. The approach used to calculate the revenue allowance adjustments is the same as that described for the DPCR5³³ price control in paragraphs 2.33 to 2.36 of reference document 5, and involves:

- (a) calculating the fast and slow money amounts that were included in or left out of GDPCR base revenues because levels of expenditure turned out to be over or under-estimated
- (b) aggregating the amounts ascertained under sub-paragraph (a) on an NPV neutral basis – ie amounts relating to earlier years in the GDPCR period are given a time value of money adjustment
- (c) calculating the fast and slow money amounts that would have been included in or left out of GDPCR base revenues if contemporaneous adjustments had been made to the licensee's RAV balance to reflect underspend or overspend amounts multiplied by the capex incentive strength percentage

³³ (Electricity) Distribution Price Control Review 5

- (d) aggregating the amounts ascertained under sub-paragraph (c) on an NPV neutral basis and
- (e) subtracting the total obtained under sub-paragraph (b) from the total obtained under sub-paragraph (d).

10.73. The outturn values needed to calculate capex incentive scheme adjustments are the licensee's actual capex and non-incentivised repex expenditure totals for each Formula Year in the GDPCR price control period, from information submissions made by the licensee in accordance with applicable RIGs.

10.74. At the outset of the price control period, the licensee's RAV balance is adjusted to reflect the difference between capex and repex expenditure levels projected for the GDPCR price control and the actual capex and repex expenditure totals referred to in paragraph 10.81, taking into account the 50 per cent capitalisation rate applicable to repex for the GDPCR price control.

Formula years in the legacy period subject to adjustment

10.75. Finalised capex and non-incentivised repex expenditure totals relating to Formula Years up to and including 2011-12 will have been available for the modelling of the licensee's opening base revenues and opening RAV balance for the RIIO-GD1 price control. However, capex and repex expenditure totals relating to Formula Year 2012-13 will not have been available when the licensee's opening base revenues and opening RAV balance were set and forecast legacy outturn levels for that year will have been used.

10.76. A legacy price control capex incentive scheme adjustment therefore needs to be made to reflect legacy outturn levels for capex and repex expenditure totals Formula Year 2012-13.

Determination of the value of the component term CAR

10.77. The steps set out in paragraphs 10.86 to 10.89 below will be followed to determine the value of the component term CAR.

Step 1

10.78. After 31 July 2013, Ofgem will obtain from price control review information submissions relating to Formula Year 2012-13 the licensee's:

- outturn capex expenditure total and
- outturn repex expenditure total

for Formula Year 2012-13.

Step 2

10.79. Ofgem will aggregate the figures obtained under step 1, and then deflate the total for 2012-13 used in the relevant price control review information submissions to the 2009-10 price base used in the PCFM using actual RPI data (see section on price base in chapter 1).

Step 3 Use of the legacy adjustment calculation workbook

10.80. The deflated total obtained under step 2 will be used to overwrite the forecast 'equalised incentive expenditure' value for Formula Year 2012-13 on the CAR worksheet of the calculation workbook.

10.81. The functionality of the calculation workbook will:

- (a) perform the calculations described in paragraph 10.80; and
- (b) deduct any adjustment amount already included in the modelling of the licensee's opening base revenues to give the incremental adjustment amount which will be shown as the value for the component term CAR.

Determination of the value of the component term CRAV

10.82. The steps set out in paragraphs 10.91 to 10.92 below will be followed to determine the value of the component term CRAV.

Step 1 Use of the legacy adjustment calculation workbook

10.83. The outturn capex expenditure and outturn repex expenditure totals referred to in paragraph 10.84 will be input to the CRAV worksheet of the calculation workbook.

10.84. The functionality of the calculation workbook will deduct the forecast levels that were used in calculating the licensee's opening RAV balance for the RIIO-GD1 Final Proposals, to give the incremental RAV additions adjustment value which will be shown as the value for the component term CRAV.

Restatement or adjustment of values used in the determination of CAR and CRAV

10.85. As set out in paragraph 8 of this chapter, a determination of each component term value will be carried out during each Formula Year of the price control period. If it is necessary for one or more of the values referred to in the paragraphs above to be restated or adjusted after use in a determination of the component terms CAR and CRAV, the values of CAR and CRAV would be determined again using the restated/adjusted values for the purpose of determining a revision to the PCFM Variable Value LAR or LRAV, for use in the next available Annual Iteration Process.

Part 5 – Determination of component value for legacy mains and services replacement expenditure adjustment

10.86. This part sets out the methodology for determining the value of the component term MRV, the RAV balance adjustment relating to the licensee's actual expenditure levels on mains and services replacement expenditure during the GDPCR price control period.

Description of the adjustment

10.87. The mains and services replacement expenditure adjustment in the GDPCR price control had two purposes:

- to flex the allowances included in the licensee's base revenue in response to outturn levels of required activity; and
- to incentivise the licensee to deliver activity at lower than projected cost levels,

whilst controlling overall cost levels for the GDPCR period (see chapter 6 of reference document 1).

10.88. The mechanism provided for:

- (a) The licensee's base revenue figures for the GDPCR price control period to include sums reflecting projected levels of mains and services replacement expenditure with
 - (i) 50 per cent of the amount modelled as capex (RAV additions) and
 - (ii) 50 per cent of the amount modelled as opex.
- (b) An adjustment to the licensee's allowed revenue in each year of the GDPCR period under a formula contained in Special Condition E5 of the GDPCR licence using:
 - (i) the licensee's actual expenditure for the year
 - (ii) an amount determined by a driver formula applying a matrix of standard costs and
 - (iii) the licensee's incentive strength percentage.
- (c) The consolidation of projected capex additions (see sub-paragraph (a)) into RAV at the end of the GDPCR period with
 - (i) no further adjustment if the licensee's total capex across the GDPCR period was lower than the total of projected capex expenditure
 - (ii) a further addition to the licensee's RAV reflecting the excess of actual capex over projected capex, but subject to an incentive strength adjustment for the overspend (with the total overspend reduced by

any annual overspend amounts which would have been addressed under sub-paragraph (b)).

10.89. The outturn values needed to calculate net RAV additions at the end of the GDPCR period are the licensee's actual expenditure levels on mains and services replacement for each Formula Year during the GDPCR price control period.

Formula years in the legacy period subject to adjustment

10.90. Finalised mains and services replacement expenditure totals relating to Formula Years up to and including 2011-12 will have been available for the modelling of the licensee's opening RAV balance for the RIIO-GD1 price control. However, the licensee's mains and services replacement expenditure total relating to Formula Year 2012-13 will not have been available when the licensee's opening RAV balance was set and a forecast legacy outturn level for that year will have been used.

10.91. A legacy price control mains and services replacement expenditure adjustment therefore needs to be made to reflect the legacy outturn level for actual expenditure in Formula Year 2012-13.

Determination of the value of the component term MRV

10.92. The steps set out in the paragraphs below will be followed to determine the value of the component term MRV.

Step 1

10.93. After 31 July 2013, Ofgem will obtain from price control review information submissions relating to Formula Year 2012-13 the licensee's outturn mains and services replacement expenditure level for Formula Year 2012-13.

Step 2

10.94. The amount obtained under step 1, in nominal prices, will be multiplied by 50% to calculate the outturn capex amount.

Step 3 Use of the legacy adjustment calculation workbook

10.95. The deflated total obtained under step 2 will be used to overwrite the forecast 'equalised incentive expenditure' value for Formula Year 2012-13 on the CAR worksheet of the calculation workbook.

10.96. The functionality of the calculation workbook will

- (a) re-perform the process set out in paragraph 10.96(c) and

- (b) deduct any RAV addition amount already included in the modelling of the licensee's opening RAV balance for RIIO-GD1, to give the incremental adjustment amount which will be shown as the value for the component term MRV.

Part 6 – Determination of component value for logged up and security costs adjustments relating to the legacy period

10.97. This part set outs the methodology for determining the value of the component terms SAR and SRAV, the revenue allowance and RAV balance addition adjustments relating to the licensee's actual efficient expenditure levels on logged up and security costs during the legacy period.

Description of the adjustment

10.98. The GDPCR price control arrangements provided for the licensee to log up certain types of cost which were not included in opex or capex allowances for that price control period.

10.99. The licensee was required to record and report the levels of expenditure being logged up on specified activities so that, for the RIIO-GD1 price control arrangements

- (a) an appropriate aggregate addition (in 2009-10 prices) to the licensee's RAV balance could be made, reflecting capex and
- (b) appropriate additions (including time value of money adjustments) could be made to the licensee's base revenue allowances (spread across the price control period) reflecting
 - a. the amounts which would have been included in base revenues and
 - b. the higher RAV balances which would have earned a return and depreciation allowance
 if the costs had been included in GDPCR opex and capex allowances.

10.100. The outturn values needed to calculate the RAV balance additions and revenue adjustments referred to in paragraph 10.104 are the licensee's efficient logged up and security costs during the legacy period.

Formula years in the legacy period subject to adjustment

10.101. The licensee's reported totals for logged up and security costs relating to Formula Years up to and including 2012-13 will have been available for the modelling of the licensee's opening base revenues and opening RAV balance for the price control period. However, reported totals for Formula Year 2012-13 will not have been available when the licensee's opening base revenues and opening RAV balance were set and forecast levels for that year will have been used. In addition, logged up

and security costs reported by the licensee are subject to an efficiency review by Ofgem.

10.102. Legacy price control logged up and security cost adjustments therefore need to be made to reflect

- reported levels of logged up and security cost expenditure for Formula Year 2012-13 and
- the outcome of the Ofgem efficiency review of logged up and security costs during the legacy period.

Determination of the value of the component term SAR and SRAV

10.103. The steps set out below will be followed to determine the value of the component term SAR and SRAV.

Step 1

10.104. After 31 July 2013, Ofgem will obtain from price control review information submissions relating to Formula Year 2012-13 the licensee's reported totals for logged up security costs (capex and opex) and for each Formula Year in the GDPCR price control period.

Step 2

10.105. Ofgem will re-base each of the figures obtained under Step 1 into 2009-10 prices (see section on price base in chapter 1).

Step 3 Use of the legacy adjustment calculation workbook

10.106. The rebased totals for logged up security costs obtained under step 2 will be used to overwrite the pre-existing logged up and security cost values on the SAR worksheet of the calculation workbook.

10.107. The calculation workbook is designed to

- (a) calculate the difference between the logged up security costs referred to in Step 2 and the logged up security values (in the same price base) used in the modelling of the licensee's opening base revenues
- (b) calculate the return and depreciation that should be allowed on the figures obtained under sub-paragraph (a) for each Formula Year in the GDPCR1 price control period
- (c) apply a time value of money adjustment to each of the totals obtained and

10.108. The value of the time value adjusted incremental revenue calculated from the above steps will be determined to be the value of the component term SAR.

10.109. The value of the incremental RAV additions value calculated in the above steps will be determined to be the component term SRAV.

Restatement or adjustment of values used in the determination of SAR and SRAV

10.110. A determination of each component term value will be carried out during each Formula Year of the price control period.

10.111. If it is necessary for one or more of the values referred to in the paragraph above to be restated or adjusted after use in a determination of the component terms SAR and SRAV, in particular following a cost efficiency review by Ofgem, the values of SAR and SRAV would be re-determined using the restated/adjusted values for the purpose of determining a revision to the PCFM Variable Value LAR or LRAV, for use in the next available Annual Iteration Process.

Part 7 – Statement of component values and determination and direction of revised PCFM Variable Values

10.112. Parts A and B of Special Condition 3A provide for the determination of revised PCFM Variable Values for Formula Year 2013-14, that relate to legacy price control adjustments, for use in the Annual Iteration Process. Determinations will be made by 30 November in each Formula Year using the formulae set out in Part A of Special Condition 3A and component term values determined in accordance with Part B of that condition and the methodologies set out in parts 1 to 6 of this chapter.

10.113. All of the outturn values needed to finalise legacy price control adjustments should be available by 31 July 2013. This means that they can be used in the determination of revised PCFM Variable Values for the Annual Iteration Process that will take place by 30 November 2013. It should only be necessary to make subsequent revisions to those PCFM Variable Values where price control review information relating to the legacy period is restated in accordance with relevant licence conditions and/or RIGs documents. The effect of any such subsequent revisions will, subject to a time value of money adjustment, be included in the calculation of the term MOD_t in relation to the Annual Iteration Process concerned.

10.114. A determination of PCFM Variable Values relating to legacy price control adjustments will be made by 30 November in each Formula Year and the overall direction of PCFM Variable Values revisions for each Annual Iteration Process will include a facsimile of the PCFM Variable Values Table(s) for the licensee. This will confirm the post direction state of PCFM Variable Values relating to legacy price control adjustments.

10.115. Part C of Special Condition 3A sets out the procedure to be used for the direction of revised PCFM Variable Values relating to legacy price control adjustments. It specifies that:

- (a) the direction of revised PCFM Variable Values must be made by 30 November in each Formula Year;
- (b) the direction must include a statement of the component term values used in the determination of any revised PCFM Variable Values;
- (c) the licensee must be given at least 14 days notice of any revisions to PCFM Variable Values that the Authority proposes to direct; and
- (d) the Authority must have due regard to any representations or objections made by the licensee during the period referred to in sub-paragraph c) and give its reasons for any decisions made in relation to them.

10.116. If, for any reason, in any Formula Year t-1, the Authority does not make a required direction of revised PCFM Variable Values relating to legacy price control adjustments, Part C of Special Condition 3A specifies that the Authority must direct the values concerned as soon as is reasonably practicable thereafter.

Appendices

Index

| Appendix | Name of Appendix | Page Number |
|----------|------------------|-------------|
| 1 | Glossary | 96 |

Appendix 1 - Glossary

A

Accounting Standards Board/ASB

The ASB is the body which issues Accounting Standards in the UK. It is recognised for that purpose under the Companies Act 1985.

Annual iteration Process

The annual iteration process is the process of annually updating the variable (bluebox) values in the PCFM and running the model in order to provide updated MOD and SOMOD values.

C

Cut-Off Date

In respect of licensees pension scheme established deficit, means 31 March 2010 for DNOs, 31 March 2013 for GDNs and 31 March 2012 for TOs and SOs

D

Defined Benefit Scheme

A pension scheme where the benefits that accrue to members are normally based on a set formula taking into account the final salary and accrual of service in the scheme. It is also known as a final salary pension scheme.

Defined Contribution Scheme

A pension scheme where the benefits that accrue to members are based on the level of cash contributions made to an individual account and the returns on those funds are used to provide a cash amount to purchase an annuity on retirement.

E

Early Retirement Deficiency Contributions (ERDCs)

The cost of providing enhanced pension benefits granted under severance arrangements prior to 1 April 2004 which were not fully matched by increased contributions

F

[Fast money](#)

The proportion of Totex which is not credited to the licensee's RAV balance and is effectively included in the licensee's revenue allowance for the year of expenditure

[Formula Year](#)

A year beginning on 1 April to which the provisions of this handbook apply.

[Funding Adjustment Rate](#)

This is the percentage calculated as $1 - \text{Incentive strength}$.

G

[GD1](#)

Prefix/Suffix designating an item relevant to the RIIIO-GD1 (gas distribution) price control review which will be applicable for the eight years running from 1 April 2013.

[PCFM](#)

The model of that name (with a Formula Year suffix):

- (a) that is represented by a workbook in Microsoft Excel ® format maintained under that name (with a Relevant Year suffix) on the Authority's website; and
- (b) that the Authority will use to determine the values of the terms MOD through the application of the Annual Iteration Process,

as modified from time to time, whether under Special Condition 2A or otherwise.

The PCFM calculates appropriate changes to the licensee's base revenue through an Annual Iteration Process - see chapters 1 and 2.

I

[Incremental deficit – see Pension scheme incremental deficit](#)

The difference between the assets and liabilities, determined at any point in time, attributable to post Cut-Off Date pensionable service and relating to Regulated Business Activities. The term also applies equally where there is a surplus for the post cut-off date regulated Notional incremental deficit sub-fund

[International Financial Reporting Standards/IFRS](#)

IFRS are accounting standards set by the International Accounting Standards board. These standards ensure comparability and accuracy of accounts.

M

[MOD Term](#)

The term of that name included in the formula for Base Revenue set out in Special Condition 1B of the Gas Transporters licence. It represents the incremental change to base revenue for the Formula Year concerned, ascertained in accordance with the methodologies set out in this Handbook. The value of the MOD term is calculated through the annual iteration of the PCFM (see Chapter 2) and is specified in a direction given by the Authority by 30 November in each Formula Year.

N

[Non-core RAV](#)

See Shadow RAV

[NPV](#)

Net present value

O

[Ofgem](#)

The Office of the Gas and Electricity Markets Authority.

P

[PCFM](#)

The RIIO-GD1 Price Control Financial Model

[Pension Principle\(s\)](#)

Ofgem's price control Pension Principles and guidance notes as set out in appendix 5 to the RIIO-GD1 Final Proposals - Finance and Uncertainty supporting document. It includes any revision to the guidance notes from time to time

[Pension Protection Fund \(PPF\) Levy](#)

The levy on pension schemes by which the PPF is financed. This levy has a number of constituent elements including a fixed element (based on scheme liabilities), and a risk based element (based on the perceived insolvency risk of each scheme). Additionally there is an administration levy charged to cover the PPF running costs

[Pension scheme established deficit](#)

The difference between assets and liabilities, determined at any point in time, attributable to pensionable service up to the end of the respective Cut-Off Dates and relating to Regulated Business Activities under Pension Principle 2. The term applies equally if there is a subsequent surplus

Pension scheme incremental deficit

The difference between the assets and liabilities, determined at any point in time, attributable to post Cut-Off Date pensionable service and relating to Regulated Business Activities. The term also applies equally where there is a surplus for the post cut-off date regulated Notional incremental deficit sub-fund

R

RAV – Regulatory Asset Value

A financial balance representing expenditure by the licensee which has been capitalised under regulatory rules. The licensee receives a return and depreciation on its RAV in its price control allowed revenues

RIIO

Revenue = Incentives + Innovation + Outputs.
Ofgem's new framework for the economic regulation of energy networks

RIIO-GD1 (Gas Distribution)

The price control arrangements which will apply to gas distribution licensees from 1 April 2013 until 31 March 2021

S

Slow money

The proportion of Totex which is credited to the licensee's RAV balance on which the licensee receives a revenue allowance to cover finance (vanilla WACC) and depreciation costs

Shadow RAV

Refers to expenditure, already incurred, which has not yet been admitted to the licensee's formal RAV balance, but which is expected to be admitted at a future point. This is also referred to as "non-core RAV"

SO

The respective operators of the Great Britain electricity and gas transmission systems

T

Time value of money adjustment

A multiplier used when the award or application of a financial value, attributable to a particular year, is deferred until a later year, even where the deferral is routine and in accordance with a price control mechanism.

In basic terms, the multiplier is $(1+X)^Y$ where:

- X is the Vanilla WACC for the licensee applicable to the period of deferral; and
- Y is the number of years of deferral

Totex Incentive Mechanism (TIM)

TIM is the mechanism that calculates the financial reward (or penalty) that companies are given in allowances for under or over spend on uncertain projects. For RIIO-GD1 Final Proposals opening base revenues will have been modelled on the basis that actual Totex expenditure levels are expected to equal allowed Totex expenditure levels (allowances). If actual (outturn) expenditure differs from allowances, for any Formula Year during the price control period, the TIM provides for an appropriate sharing of the incremental amount (whether an overspend or underspend) between consumers and licensees

TO

The companies which own and operate the gas and transmission networks in Great Britain

Totex

See Chapter 6 paragraphs 6.18 – 6.19

Totex Capitalisation Rate

The percentage of Totex which is added to RAV (slow money)

Triennial Valuation

An actuarial valuation of a pension scheme which has been carried out to meet the requirements of Section 224(2)(a) of the Pensions Act 2004 and which details in a written report, prepared and signed by the Scheme Actuary, the value of the scheme's assets and Technical Provisions. Actuarial valuations are usually produced triennially but the term may also refer equally to any full actuarial valuation that is not an Updated Valuation

U

Updated Valuation

A report, prepared and signed by the Scheme Actuary, which updates a Triennial Valuation to a later date.

W

WACC

The Vanilla Weighted Average Cost of Capital is Ofgem's preferred way of expressing the rate of return allowed on the Regulatory Asset Values (RAV) of price controlled network companies. The use of Vanilla WACC means that the company's tax cost is separately calculated as a discrete allowance so that only the following have to be factored in:

- the pre-tax cost of debt - ie the percentage charge levied by lenders, and
- the post tax cost of equity – ie the percentage return equity investors expect to actually receive,

weighted according to the price control gearing assumption.

"Real Vanilla WACC" is used which gives a lower percentage than "Nominal Vanilla WACC" would (when inflation is positive). This is because inflation isn't taken into account in the determination of the Real Vanilla WACC percentage since revenue allowances (which include the Vanilla WACC return) are separately RPI indexed.
