**Response to Ofgem regarding the consultation on the HVDC
interconnector link between Shetland and Mainland Scotland.**

To whom it may concern,

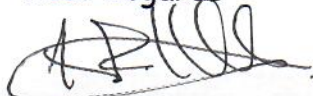

I run a small engineering company supporting the fishing industry in Shetland, my main job is working as Chief Engineer on one of the newest pelagic trawlers in Scotland.

During the building phase of the new trawler we were very aware of environmental issues and took every step possible in limiting our emissions and eradicating pollutants.

I have always been a great supporter of renewables and for this reason our company has invested in Energy Isles, however I am of the opinion that the proposed 600 MW link proposed will limit opportunities in Shetland to harvest the best natural resources which is wind and tide.

The projects that are live at the moment namely Viking Energy, Mossy Hill and Beaw Field means there is limited capacity and restricts the viability of Energy Isles unless Ofgem recommends developing an 800 MW or a 1000 MW option.

Best Regards

Alex Fullerton
