

To Whom it may concern.

I am very saddened to learn that the UK government is bring serious about putting up a Windfarm in Shetland- which are probably among the last paradises in the world. I cannot understand how anyone would do that. Its a very small and vulnerable population. Today there is massive evidence on infrasound and what infrasound causes and how it affects all living beings. I am aware that renewable energy can save money and environment on short term basis, but when it comes to peoples lives, what is it worth then? Short term it might be rentable- but what about the long term consequences? I think you should look at the costs - human - and wild life- deaths and a Wide range of illnesses infrasound causes, and then calculate again. Do you make sure to at least double NHS staff(they can't really cure anyone from the stress symptoms and other diseases that infrasound causes)?

Why would you do this to such a unique population and environment? It doesn't make any sense. So much ancient culture, traditions etc. Why? What are Shetlanders supposed to do if windfarms there becomes a reality? Are they supposed to move? Where to?

I Love Shetland, my friends live there, are born and raised there. Think about it. What if it was you?! Believe me, this will be very expensive in the end, and I can promise you that it is just not worth it.

I hope that someone will wake up in your government and stop this insane idea. Thanks
