

To whom it may concern,

I wholeheartedly object to the proposal to go ahead with the Viking Energy wind farm. It would be ludicrous to build the UK's biggest windfarm on the smallest and most remote island, involving the most expensive subsea cable, when there are so many more cost effective options being explored.

The site involved is questionable for its stability /depth of peat, and will turn our beautiful island into an industrial site.

The reliability is not proven either, so a 'back up' was always going to be needed. From the outset, the BWSC/GASNOR gas powered station looks increasingly more like the favoured option, going forward.

I do hope you look at all the options (not just 'green' targets), and pull the plug on this.

Kind regards,
